This old line of road, therefore, is not without considerable interest for those who care to trace the connexion of historical events with the outline and topography of a district. After leaving Okehampton the traveller has on his right the wild valley of the Ockment, with the ruins of the "prænobile castrum" of the Courtneys, as William of Worcester described it, rising on a long rocky knoll on the opposite side of the river, and half shrouded by tall, wind-swept ash-trees and acanorres. The existing remains, which must have entirely supplanted the Norman fortress that we know to have existed here, are those of a small but very perfect castle of Edward I.'s time; with a square keep on the highest point of the ridge (which has been cut through beyond it, possibly by Norman engineers), and with well-defined hall, chapel, and other offices in the great court below. Looking down on the position, it is seen at once to be the key of the valley, and to command the old Western road, which wound along the base of the moorlands beyond the castle. These moorlands we have on our left—wide, dusky sweeps of heather, stretching upward, height beyond height, to a distant range of tor-crests—the great natural fortress which interposes itself between North Devonshire and Cornwall, and which must have assisted not a little in enabling the British kingdom of Damnonia to maintain for so long a time a part of its ancient independence. The very keep of this stronghold, the "arx" of the Dartmoor hill fortress, is the great bastion which above and beyond Okehampton projects itself into the lower country, and along the extreme skirt of which the railway is carried. This contains the highest ground in the south of England, the highest ground south of Ingleborough and Pen-y-ghent. It is a grand group of furrowed hills, broken and jagged in outline, with deep-trenched hollows lying between them, advanced considerably beyond the general mass of Dartmoor. The whole contour—and it is a very fine one—is best seen from some distance, and nowhere better than from the high ground of Winkleigh, where an English fortified house, older than the Conquest, looked straight across from its lofty mound into this group of hills. Seen from such a point nothing can be more striking than the constantly changing effects produced by the misty highland atmosphere, always full of moisture. The hills, to use Wordsworth's term, are "spiritualized" by the mist wreaths that float among them, and

by the shafts of sunny light that strike suddenly on some rocky summit, or on some patch of high-lying greensward. Yestor (2,050 feet), one of the loftiest and most conical of these hills, is often visited from Okehampton, though the pilgrimage to the summit is a rough one. The higher crest of Wilhays (2,090 feet) and the more distant plateau from which Furtor rises in the midst of desolate morasses, are comparatively little known, and indeed for the greater part of the year are scarcely accessible by any creature less sure-footed than a hill fox or a hare. This is the watershed of the country, the region in which many of the Devonshire rivers, the Dart, the Teign, the Taw, and the Torridge, steal from their fountains. It is distinguished by long, green, flat-topped ridges, very different from the true tors, three or four of which, however—Yestor and Furtor are the most important—are included in this district. From the edge of the highest plateau, or from the summit of one of the remoter ridges, the scene is one of unusual desolation, even for a mountain region. It is the true "dey-sirt" of Dartmoor, as the natives call it. The deposit of peat here, sometimes twelve feet in thickness, is unbroken; it is the decay of a past age, which barely retains the power of supporting such scanty representatives of insect and vegetable life as have descended from a Glacial period, and have been preserved by the evaporation from the vast mass of peat, which never allows the atmosphere to become even warm. So damp is the climate that filmy ferns grow on the open summit of Furtor—a rocky citadel not to be reached without a struggle, and indeed, if the weather be at all uncertain, not without some danger. Its extreme isolation has no doubt helped to preserve small patches of cowberry and crowberry, which remain on the sides of the tor, and are not found elsewhere on Dartmoor, or nearer to Devonshire than the central parts of Wales. These plants tell their own story; and, it may be hoped, will not be altogether uprooted by such ruthless spoilers as cannot understand it. Happily, Furtor is beyond the reach of ordinary wanderers; and the whole region, strange and impressive as it is, has but little charm for the multitude. Its lifeless solitude—there are no dashing streams, no birds, and the hum of an insect rarely breaks the silence—affects the imagination almost as powerfully at present as in that distant day when the first English settlers in the country found an entrance to their mysterious under-world in Cranmere (the "more of herous," still called "cranes" in Devonshire) high among the peat ridges. Cranmere, formerly, it may be supposed, a lake of some extent, is now little more than a morass, and is quite dry in summer. But, like so many pools on high ground or on mountain summits, it is still held to be the "gate" of an unknown country, and strange cries and wailings are heard to proceed from it:—

Continuū audite voces, vagitus et ingens.

The place is by no means easy to find; and is sufficiently gloomy and desolate.

The highest part of this wild ground, so far as it has been examined, betrays few or no signs of ancient habitation. There are, it is true, some small tumuli and hut-circles on the south slope of Amicombe hill—one of the encircling ridges; but, at least within the historical period, the greater part of the district can only have been inhabited by those who sought it as a "flemens-firth"—like the lady of Branksome's tower. The lower but still wild moorland ground which forms the north-eastern border of Dartmoor abounds in primitive stone relics which indicate that at one period it must have been thickly populated. Groups of hut-circles, and of stone enclosures connected with them, are numerous; and whilst they are scattered almost on every hill-side, they seem to arrange themselves into three or more great divisions, in each of which is found some one hut or dwelling-place of far greater importance than the rest, marking apparently the abode of the chief or head man. No local tradition whatever has gathered about these remains, unless it be a saying—applied to the long parallel rows of stones which abound on Dartmoor, rather than to the hut-circles—that they were raised when flying serpents haunted the hills, and wolves the lowland. Nothing is known about them; and a moorman whose forefathers have lived on the same ground for long generations can only say that "he never heard no word how they steane walls got there." This entire absence of tradition, in a mining district where old forms and habits are carefully retained, and where there is no lack of oral record about all such matters as interest the people, must be taken into account in considering the possible age of the remains. The bases of the circular walls are often formed of large granite blocks; and in some instances the walls, of considerable thickness, remain piled up to the height of perhaps a foot. But, except now and then a thin layer of charcoal toward the centre, it is not known that anything—coins, bones, or pottery—has been found in or among them. Such relics as have been dug out of tumuli on Dartmoor, and as have been discovered from time to time in hill-forts and on other ancient sites all along the south coast of Devonshire, point unquestionably to the Bronze period as one of much activity in this region; and it may well be that many of the Dartmoor settlements date as far back as that age. This of course is assigning to them a great probable antiquity; but it is certain that the tin of these moorlands was worked at a very early period, and nothing is more likely than that the foreign traders, whoever they were, should have introduced the use of bronze—manufactured in part from the native tin—in this corner of the island. It is remarkable that hardly a stone weapon or implement has been found in Devonshire. A few flint arrowheads have indeed been

turned up, from great depths in the peat, by the Dartmoor prisoners; but, on the other hand, the "finds" of bronze weapons have been numerous and important. Collections of celts (so called) have been brought to light from under granite blocks, mostly on the borders of the moor. Some have been dragged up from the beds of the streams, or from such half-morasses as the "bloody pool," close to Brent. A great hoard of weapons—sixteen celts, many daggers, and other pieces of worked bronze—was found in 1868 under a stone at Plymstock; and in 1872, in a singular tumulus raised high on the ridge of Hameldon, besides fragments of a bronze sword and dagger, an ornament of amber was discovered, minutely set with gold points, and indicating no small skill on the part of the workman. Hameldon looks down on Grimspond, one of the most curious of the walled enclosures, containing hut-circles within them, to be found on Dartmoor. We can hardly but suspect that these enclosures, whatever other purposes they may have served (and protection was required from wolves and wild animals, the old denizens of the forest), were the gathering places to which tin was brought from the neighbouring "goyles" and stream works. The very large and unusual settlement at Batworthy, on the hill above Chagford, with lines of wall crossing and recrossing among the circular huts, and forming enclosures of very small size, may well have been the chief tin emporium on the north side of the moor—the primitive "stannary town," whose importance was gradually transferred from the hill to the valley. There is no spot on Dartmoor which will more exercise the antiquary. Long parallel rows of stones run along the heaths very near the hut-circles, as indeed is the case with almost all the larger settlements. This alone is sufficient to prove that the circles and the stone rows are in some kind of connexion. Beyond that it is hardly possible to advance. Mr. Fergusson's theory that such avenues mark the scenes of great fights is certainly not borne out by the positions, the associated remains, and the considerable numbers of these stone rows on Dartmoor.

This north-eastern corner is, as we have said, hardly the most picturesque portion of Dartmoor. That distinction belongs to the valley of the Dart, with the moors and "brue-sides" that lie around and above it. But it contains some wild and fine "cleaves" and passes; and for those blessed with real eyesight it is impossible to walk half-a-mile across it without finding speculations from place-names and ancient relics, from the shattered tors and the plants sheltered among them, suggested at every step. As for the "no-eyes" of the old story, they will probably exclaim with Justice Shallow—constrained to admit his one qualifying recommendation—"Barren, barren; beggars all, beggars all. Marry, good air."

STARRING AT THE ABBEY.

THE Dean of Westminster has indulged in another little triumph of absolute power. A Scotch minister has been introduced into the Abbey in succession, and possibly as an antidote, to the open-minded philosopher who had the distinguished honour of being employed as the Dean's first widge. It may be supposed that an argument intended to prove that Christianity is really the only true faith is, on the whole, likely to be a more lively stimulant to missionary effort than an impartial and dispassionate exhibition of the equal or superior attractions of various forms of heathenism. Possibly, however, the Dean may have regarded as comparatively immaterial the particular line of argument which might be taken by the performer of the day, and may have acted simply on the rule which is followed by other managers of popular entertainments, that variety is indispensable in keeping up good houses. In the theatrical world there is a familiar expedient by which, when the efforts of the stock company begin to flag, or at least to lose their hold upon the public, a star is brought in as a new sensation. Indeed this plan has of late, we have heard, been much developed, so that there are now not only single stars, but whole starring companies, which travel about the country with the necessary scenes, properties, and posters, and make themselves at home for a week or two in any theatre which is in want of a stirring novelty. We should be sorry to imagine that there is any real ground for the reflection which Dean Stanley's engagement of outsiders might seem to cast on the regular members of his company. He has already a numerous staff at his disposal, and we should have thought that the eminent novelist who is one of his canons hardly deserved to be shelved as a supernumerary. It is a melancholy thing when a man who has strutted as Hamlet has to stalk as the Ghost. As yet Dr. Stanley is only in the initial stage of the starring business. For the present he is content with one star at a time, and provides the walking gentlemen and the band from his own stock company. There is no reason, however, why the plan should not gradually branch out and develop itself in true Darwinian style on the ecclesiastical as on the histrionic stage. We may expect in time to find one day that the whole of the regular performers, orchestra and all, have got a holiday at the Abbey, and that an entirely new company, with its own dresses and decorations, has been put in possession of the building. In such a case the great thing is to make a beginning, and certainly a beginning has been made.

It has hitherto been supposed that Westminster Abbey is one of the edifices of the Church of England, and that as such it is dedicated exclusively to the services of that Church. It is admitted that, if Dr. Caird had been allowed to preach from the

pulpit, there would have been a violation of the law, and of course Dean Stanley is the last man who would think of breaking the law. We are not concerned to deny that the use which was made of the Abbey on Monday last may have been, in the strict technical sense of the term, perfectly legal; but it is highly instructive to observe the elaborate and crookedly ingenious precautions by which this legality was secured. In the first place, the preacher delivered his address from the reading-desk, and not from the pulpit. Next, the preacher was called a lecturer, and the address a lecture, and not a sermon. The lecturer, we are told, wore his University gown and hood and carried a college cap in his hand. Nothing is said about his bands, and we can only trust that everything was legal in that respect. The Dean and Mr. Kingsley "wore black gowns, but without their hoods"—mark, "without their hoods"; if they had had their hoods on, we suppose, that would have made all the difference. A Speaker of the House of Commons was once asked what would happen if he carried out the threat which he sometimes used of naming a member? The "Lord in heaven only knows" was the reply; and possibly the consequences which might have followed if the Dean and Mr. Kingsley had gone so far as to wear their hoods as usual are wrapped in similar mystery. Then the report goes on to speak of the "small procession, if procession it could be termed." Here we have a striking illustration of the embarrassing difficulties attending an effort to keep close to the law, while breaking its obvious spirit and intention. The persons engaged in the attempt are so afraid of getting on the wrong side of the line that they can hardly trust themselves to say what they are doing, or to give a name to anything. It is perhaps a nice question for an ecclesiastical lawyer whether the Dean and "Canon" Kingsley may not have got into a scrape by allowing themselves to be designated by titles which impart a religious aspect to the service—"if service it could be termed," we ought perhaps to say—at which they assisted; and though they may flatter themselves that they were saved by leaving off their hoods, it would perhaps have been more prudent to have taken some more demonstrative method of disavowing their clerical character, such as wearing Tweed shooting-coats and wide-awakes. Well, this small procession—and we use the phrase without venturing to express any opinion on the delicate and serious question whether it could really be termed a procession—"was preceded by only a single verger, who conducted the lecturer to the eagle lectern, which had been placed at a short distance from the screen." As there was only one verger, it would seem that the Dean was afraid to have two; but it may be argued that the ecclesiastical principle or idea of a verger is as much embodied in a single specimen as in a couple. As to whether the verger wore his usual robes the report is silent. And did he carry his mace or staff? It seems to be acknowledged that, if the Dean or Mr. Kingsley had taken part in the ceremony with their hoods on, it would have given the proceeding a taint of illegality; but the verger also is an officer of the Cathedral, and it may be asked whether his official costume and mace of office can legally be used in order to give ecclesiastical dignity to a Scotch clergyman. Perhaps the most singular feature in the affair was the way in which everything had to be twisted out of the usual course in order to keep up the make-believe of the lecture not being a sermon. Thus the lectern was moved to a new place, the minor canons were lodged in the seats of the choir, and the Dean at the close said the Benediction as a prayer, instead of pronouncing it as a blessing. The wonder is that the lecturer himself was not made to preach upside down or suspended from the roof like a flying Cupid.

Dr. Caird is of course a person of unimpeachable orthodoxy. It is probably only a geographical accident that he should happen to be a minister of the Church of Scotland instead of a clergyman of the Church of England, and the sermon—or, we beg pardon, lecture—which he preached last Monday in the Abbey was just the sort of thing which might have been preached or read by any one out of hundreds of clergymen in the Church which Dean Stanley represents. This, however, seems to us rather to add to than to diminish the force of the question why the Dean should have gone out of his way to introduce into the pulpit of the Abbey—for the use of the lectern is of course a mere quibble—a minister of another denomination in order to do what could have been equally well done by a clergyman of his own Church. It is important to observe that, though Dr. Caird is, as we have said, unexceptionably orthodox, his orthodoxy had nothing whatever to do with his title to preach in the Abbey. He preached simply because the Dean chose to allow him to preach, and there is, as far as we can see, nothing whatever to prevent the Dean from according a similar privilege to anybody he chooses, whether minister or layman. If a Presbyterian preacher may have the use of Westminster Abbey, why not a Greek, or Arminian, or Roman Catholic preacher? or, instead of Mr. Max Müller, a Brahmin or Bhuddist to speak for himself? It may be said that Dr. Stanley's caution and good sense will be a sufficient security against his lending himself to any scandalous abuse of the practice which he is now introducing; but it is unnecessary to treat this as a personal question. What Dean Stanley claims is the absolute right of giving up the Abbey to any sort of service or entertainment which he may choose to sanction; and this is a right which, if it is established, will of course not die with him, but will pass on to his successors. It is written in an old History of the Abbey that the Abbots, "generally being near the Court, were Favourites, and assisted at the Births, Coronations, and Anointings of several of our Princes," and that they did not fail to make use of this proximity for their own aggrandizement. At the request of

Edward the Confessor, the Pope granted to the Abbot of Westminster "independence of any Episcopal Power or Visitation, the Pope's excepted." It is this absolute and unchecked authority which Dean Stanley, as the Abbot of our day, now claims the right of exercising. It may be thought that there is something not particularly edifying in the spectacle of a high dignitary of the Church resorting to all kinds of paltry subterfuges and disguises, in order to keep on the safe side of the letter of the law which he is consciously and deliberately violating in spirit and intention. This, however, is a small matter compared with the possible consequences of throwing open the Abbey to preachers, orators, and—for that will be the next thing—entertainers of every kind. Westminster Abbey, it should be remembered, is not a Pantheon, but a Church. It is an ecclesiastical edifice which is identified with a particular form of religion, and dedicated to well-defined uses. It may or it may not be a good thing that its use should continue to be limited by such conditions as have hitherto attached to it; but assuredly a revolution of the kind now attempted ought not to be left at the discretion of a single official. Dr. Stanley's leanings are not perhaps very likely to lead him towards Archbishop Manning; but the theory that one Church is as good as another, and better too, might, if freely carried out, introduce the Abbey to some still stranger acquaintances. In the course of a few months the people of London are threatened with a visit from two American Revivalists, as they are called, Messrs. Moody and Sankey, who have been in Scotland and Ireland, and are gradually working their way up to town, leaving the usual traces of revivals behind them. It appears that Mr. Moody mixes up the Gospel with comic stories of the kind ordinarily associated with the "negro delineator" with blackened face and banjo, while Mr. Sankey sings hymns to rousing tunes of carnal vivacity. By the stirring melodies of the singer and Mr. Moody's startling alternations from the awful to the grotesque the audience is worked up into a high state of excitement, women faint, children cry, and everybody is supposed to be converted. There can be no question as to the popularity of this sort of entertainment in places where it has hitherto been tried, and no doubt it would be a great success at the Abbey if the Dean thought of taking it up. We do not mean to imply that there is any resemblance between Dr. Caird's discourse and the eccentricities of Mr. Moody; but the authority which Dean Stanley claims would equally enable him to introduce one or the other. It is possible to imagine a Dean whose turn of mind might lead him to think that the services of the Abbey are scarcely so lively as they should be, and there is an obvious peril in leaving so important a question at the sole discretion of one man who may not be discreet.

RECENT ROMAN CATHOLIC PASTORALS.

THE controversy raised by Mr. Gladstone's pamphlet has entered on a new phase. The stream of newspaper correspondence has not indeed ceased to flow, though it flows less freely, but the Roman Catholic Bishops are now stepping to the front in their official capacity, and pronouncing *ex cathedra* in Advent Pastorals on the burning question of the hour. Three such documents appeared in Monday's *Times*; one addressed exclusively to Catholics, another directed not to, but at, Mr. Gladstone, and the last—which is far the most weighty of the three—designed to reassure Protestants as to the civil allegiance of their Roman Catholic fellow-citizens, and in fact offering frankly and fully the very pledges which Mr. Gladstone asked. Perhaps a word should be said first of the new Bishop of Nottingham's suicidal attempt to answer a part of Lord Acton's indictment. Dr. Bagshawe, who, like Dr. Manning himself, was raised to the episcopate by Papal nomination over the heads of all the candidates selected by the Diocesan Chapter, has only succeeded in running his head against a brick wall. Urban II. could hardly have taught more explicitly that killing excommunicated persons is in itself an innocent, if not meritorious, act, than by directing that, in case of the intrusion of some lower or more personal motive than pure zeal for religion, "a penance" should be imposed—perhaps the recitation of the seven penitential psalms, which was the penance imposed on Galileo. The best men so seldom act from purely unmixed motives that there might well be room for such a caution in dealing with the most splendid feats of pious heroism. Another of the Vatican apologists, Dr. Johnson, flounders more deeply in the mire at every fresh attempt to extricate himself; but we shall have occasion to refer to his "final letter" presently, in connexion with Archbishop Manning's Pastoral, which stands first on the list.

The Archbishop does not concern himself here at all with outsiders; he neither argues, preaches, nor persuades, but contents himself with discharging anathemas at the heads of the recalcitrant members of his own unruly flock. "Events which unhappily are notorious" lead him to declare that "whosoever does not in his heart receive and believe the doctrines of the Immaculate Conception and of the infallibility of the Vicar of Christ does by that very act cease to be a Catholic"; and such persons are accordingly warned that in receiving the Sacraments "they commit a sacrilege to their own greater condemnation." Hard words these, and difficult to answer, because a denunciation, like a sneer, is beyond the reach of argument. But it so happens that the Archbishop is indiscreet enough to cite the authority for his denunciations, and so far certainly he does lay himself open to a very telling retort. How Lord Acton and Lord Camoys, and those who agree

with them may relish the Christmas gift bequeathed to them by their chief pastor on his departure for Rome, it is not for us to say, but it is at least conceivable that they may decline to accept his exhortation to execute a kind of spiritual *felo de se*. And it is quite plain that they would have no difficulty in justifying their refusal from a strictly Roman Catholic point of view. Indeed the very fact that Dr. Manning made a very similar announcement as to the obligatory character of the Vatican dogmas in a Pastoral issued just a year ago is in itself a suspicious circumstance; an obligation which requires to be constantly reaffirmed can hardly be so generally acknowledged as he wishes us to believe. But that is a minor point. Our readers will recollect the dispute between Mr. Archer Shee and Dr. Johnson as to the real nature of the Vatican Decrees, which the former maintained to be Papal edicts, and not canons of the Council. We quoted Cardinal Antonelli's Circular last week in proof of the correctness of this view, and now Archbishop Manning unexpectedly comes forward to support us by citing the document at length as his authority for declaring all who reject Papal infallibility to be heretics. The Cardinal, writing from headquarters to announce that the infallibilist dogma is "obligatory on the whole Catholic world," does not once call it a canon of the Council, but "the Apostolic Constitution published in the Session of the Vatican Council on the 18th of July"; and he rests the obligation of receiving it, "according to the well-known rule," on its having been "put up with the customary formalities in the usual places of Rome"—that is, in the usual places where Papal Bulls are affixed. In other words, he relegates it to the same category as any other dogmatic Bull, such as the *Unam Sanctam* of Boniface VIII., whose teaching Dr. Manning himself, as a contributor to the current number of *Mamillon's Magazine* clearly proves, has, in a recent letter to that magazine, directly contravened. And the case is made still clearer by the Archbishop's going on to cite the Bull *Ineffabilis*, defining the Immaculate Conception, for which of course no one ever claimed Conciliar authority, and which is thus, quite rightly, placed strictly on a par with the definition of Papal infallibility. Indeed, if any distinction is to be drawn between the two, the former has a much higher authority. For, in defining the Immaculate Conception, Pius IX. at least confined himself to endorsing what had for many centuries been the almost unanimous belief throughout his own communion; whereas the definition of Papal infallibility not only contradicts the dogmatic decrees of two infallible Councils—those of Constance and Basle—ratified by three Popes, but is in the teeth of what had up to that moment been the belief of a considerable, and that the most learned, section of Catholic divines, which was moreover formally declared less than fifty years ago to be Catholic doctrine by the entire Roman hierarchy of Great Britain and Ireland. If Lord Acton and Lord Camoys have "ceased to be Catholics" by contravening the Vatican definitions, they may fairly inquire whether the Archbishop has not ceased to be a Catholic by contravening the definitions of Constance and Basle, taken in any intelligible sense of the words. And if there is some esoteric sense, known only to the initiated, in which the decree of Constance affirming the supremacy of Councils over Popes, even in matters of faith, is compatible with the Vatican Decree affirming the sole infallibility of the Pontiff independently of the consent of the Church, there may as well also be some esoteric sense in which Dr. Manning's assertion of Papal infallibility and Lord Camoys's denial of it mean at bottom just the same thing. This difficulty would equally hold good if the Vatican Decrees were the work of an undisputed General Council; but Dr. Johnson's "final" attempt to prove that such is the case is even more fatally damaging than any of his previous arguments. He has at length been brought to admit the fundamental difference between the methods of procedure at the Tridentine and Vatican Councils; but he pleads that there is precedent for the Vatican mode, and proceeds to refer to "the Ecumenical Council which immediately preceded that of Trent," by which he means, not the Council of Florence, but "the Fifth Council of the Lateran"; a hole and corner synod of some sixty Italian Bishops convened by Julius II., whose ecumenical authority was never admitted in any Catholic country, was ignored at Trent, and is allowed by the Ultramontane Italian divines Bellarmine and Muzzarelli to be doubtful, while till within the last few years the Synod has never even by Ultramontane theologians been foisted into the catalogue of professedly General Councils. We may add that, on Dr. Johnson's hypothesis, the Vatican definitions would have been quite superfluous, for the Bull *Pastor Aeternus*, promulgated in the fifth Lateran, anticipated the teaching as well as the title of the Apostolic Constitution promulgated in the Vatican Synod, and, like it, made a clean sweep of the decrees of Constance and Basle. As it is, the decree which is to prove the Pope's infallibility derives its sole authority from the assumption that the Pope is infallible.

Bishop Vaughan of Salfo has revived a style of controversy which was supposed in these days to have become obsolete. "Infamous outrage," "astounding folly," and "disgraceful ignorance" are the sort of charges he hurls freely at Mr. Gladstone's devoted head. They do not call for any comment here. Very different both in tone and substance is the Pastoral of Bishop Clifford, who was, as our readers may remember, one of the most active and influential members of the Opposition at the Vatican Council. Dr. Clifford, who represents the English Roman Catholic aristocracy, and never forgets that he is an Englishman as well as a bishop, grapples directly with Mr. Gladstone's impeachment of the loyalty of his co-religionists, and his language fully bears out the claim he has

since made in a letter to the *Times* that his treatment of the subject is "frank and free from ambiguity." How far it will satisfy Archbishop Manning is another question, but it ought certainly to satisfy those to whom it is addressed. He first calls attention to the facts of the case:—

Nearly half a century has elapsed since the passing of the Catholic Emancipation Act. During that period Catholic peers and Catholic members have sat in Parliament; Catholic judges and Catholic magistrates have administered justice on the bench; Catholic barristers have pleaded at the bar; Catholic soldiers have fought in the army; Catholics have served their country in every office of trust. During the whole of that period the public voice of the country has proclaimed that Catholics have proved themselves to be loyal. Nobody, then, has the right to put Catholics on their trial and say that they should be considered guilty of a want of loyalty unless they can prove themselves innocent of the charge. We say we are loyal, and we claim the right to be taken at our word.

And then, coming to the Vatican Decrees, without entering on any discussion of their nature or obligatory force, he observes that "the Council has not abrogated the Decalogue," and "the Pope cannot change moral precepts or reverse articles of faith already defined," in which case his reversal of the Decrees of Constance must be considered null and void. Nor does it follow, because all human actions are moral, that all come under Papal jurisdiction:—

When we say that the supreme direction of all that regards morals belongs to the Pope, we no more say that he has the power to make wrong right and right wrong, or that he may ignore or transgress boundaries already fixed between the temporal and the spiritual powers, and so interfere with the allegiance of the Roman Catholics, than we mean to assert that our lives and liberties are at the mercy of the Sovereign when we say that he reigns supreme over this realm. This is a question which touches the authority of the Pope, not his *magisterium*. Infallibility regards the latter, not the former, and to say that the Pope is infallible is not to say he is impeccable. It does not follow because the Pope has supreme power, no Pope has ever abused it. . . . If the Pope were to abuse his power as to seek to interfere in that which undoubtedly belongs to the civil authority, Catholics would resist it. Every Catholic Bishop in England, in the oath he takes at his consecration, acknowledges not only his spiritual obedience to the Pope, but also that his civil allegiance is due to the Queen, and the Pope cannot release the one party from the obligation without the consent of the other. It follows that the Pope has no power to free English Catholics from their allegiance.

This, we admit, is frank and unambiguous, and it concedes all that Protestants can reasonably require; nor is it any concern of theirs that, to say nothing of the *Unam Sanctam*, the Bishop has in so many words contradicted the infallible Syllabus, which affirms that "no Pope has ever abused his supreme power." It is true that the *Osservatore Romano*, the official organ of the Vatican, informed us only the other day that "he is not a Christian who does not recognize the Syllabus as his law; a law superior to all other laws, because it is divine." And it is barely two months since the Chilean Bishops excommunicated all the members of the Government and Legislature who had voted for certain alterations of the penal code which displeased them—which is surely "to ignore the boundaries between the temporal and spiritual powers." We are quite content, however, to accept Bishop Clifford's assurances, and will leave him to settle with his Archbishop whether by giving them he has *ipso facto* "ceased to be a Catholic and made shipwreck of the faith." He may at least console himself with the reflection that, if he is in error, he errs in good company.

DR. KENEALY.

THE disaster which has just overtaken Dr. Kenealy is another illustration of the old story of the earthenware pipkin and the iron pot; the pipkin would keep on bumping itself in the water against the pot, and the more it bumped the more certainly it precipitated its own destruction. Dr. Kenealy has insisted, in spite of every sort of warning and advice, in knocking his head against the wall of professional discipline, and he has had it broken in consequence. Under this catastrophe Dr. Kenealy may possibly be pitted; but if anybody is to blame for it it is himself, and himself alone. It is evident that the Benchers of Gray's Inn were extremely reluctant to proceed to extremities, and that they would gladly have availed themselves of any plausible reason for refraining from publicly degrading a man of undoubted talent and capacity, who was, moreover, an old friend and colleague. As Dr. Kenealy persisted in refusing either to deny, explain, or apologize for his connexion with the journal called the *Englishman*, the Benchers had no alternative but to strip him of privileges which he was flagrantly abusing. There is, it seems, to be an appeal to the Judges, and it is unnecessary to anticipate the result. It may be remarked, however, that, unless Dr. Kenealy can clear himself of his apparent connexion with the *Englishman*, it is difficult to see on what ground the Judges can reinstate him in the position from which he has been displaced. As far as the decision of the Benchers is concerned, a man who wilfully remains mute when put upon his defence has no right to complain if his silence is construed as practically a confession of guilt. The question as between Dr. Kenealy and the Benchers is of the simplest kind. One of the conditions on which Dr. Kenealy was called to the Bar was that he was a student of Gray's Inn was that he would submit to the usual discipline of the profession as enforced by the Masters of the Bench, and Dr. Kenealy must himself as a Benchers have often taken part in inquiries as to the alleged misconduct of members of the Inn. When a man is called to the Bar he does not acquire a right to be at any time elected a Benchers even though he should attain to the dignity of Queen's Counsel, which is the usual quali-

fication for the honour. It is a distinction which the Benchers can give or withhold or take away at their discretion, and the grounds on which they act may have reference only to private character. It is in fact very much a social question. Disbarring, however, is an extreme penalty, which can be inflicted only for serious professional reasons. The Benchers are not entitled to disbar a man merely because he is in some way personally offensive. There must have been something in his behaviour which makes it injurious to the character and discipline of the Bar that he should remain a member of it. And this is the offence for which Dr. Kenealy has been condemned. He was warned when he was disbarred that, if he continued to identify himself with the *Englishman*, the Benchers would be compelled to consider whether he ought not to be disbarred. As after this the *Englishman* continued to come out under Dr. Kenealy's name just as before, only with more virulence in its libels, the question of disbarring was necessarily forced upon the Benchers, and they had no alternative but to pass the sentence which the circumstances of the case imperatively demanded.

No reasonable person can require much reflection in order to see that, if any sort of discipline is to be maintained at the Bar, it is impossible that a barrister can be allowed to combine the publication of such a work as the *Englishman* with the practice of his profession. Unfortunately, however, there are, as the Tichborne trial proved abundantly, a great many persons in the world who are not reasonable. It would be too much to expect that the cry of the foolish people who still cling to the idea that the Claimant is really Roger Tichborne will not be once more raised on behalf of the Claimant's counsel. It may be taken for granted that the class which is represented by the paper for which Dr. Kenealy has suffered will now be more than ever convinced that a great conspiracy has been organized in the interest of the aristocracy and the Jesuits for the purpose of crushing a Claimant who is a Protestant in his convictions and plebeian in his tastes, and everybody who has dared to side with him. It is not creditable to the intelligence of the age, but we fear it is too true, that a great many persons will be ready to swallow any absurd and extravagant story which may be circulated about the vindictive persecution of a brave lawyer for attempting to expose the corruptions of the Bench. The questions which arise are really only two—whether Dr. Kenealy should be held responsible for the articles which have appeared in the *Englishman*, and whether such articles are compatible with the respect which a member of the Bar is bound to show to the tribunals before which he practises. On the first point it may be observed that, in a conspicuous part of the front page of the paper, immediately under the title, appears in large type the announcement, "Edited by Dr. Kenealy, Q.C.," and that the paper also contains a very minute and confidential account of Dr. Kenealy's movements and intentions, as well as articles and letters to which his signature is attached. Moreover, Dr. Kenealy has never disowned his connexion with the *Englishman*; he has merely said that it has not been proved. Under these circumstances most persons will be disposed to think that his name has not been used without his consent.

* The other question is as to the nature of the publication. It is described in the Resolution of the Benchers as "replete with libels of the grossest character." It had previously been described by the Lord Chancellor as "a series of libellous attacks on Her Majesty's Judges, and private individuals, and also a succession of systematic charges of bias, venality, and corruption against the persons concerned, whether as judges, jury, counsel, or otherwise, in a recent prosecution of the Queen v. Castro, all tending, and apparently intended, to lower the dignity of the Bench, and to degrade and discredit the administration of justice." Anybody who will take the trouble to turn over a few numbers of the *Englishman* will see that these are accurate, but perhaps rather mild, descriptions of the sort of libellous rant and reckless slander with which that paper is filled. The Benchers of Gray's Inn are denounced as "an infamous Cabal" which should be "spat upon by every lover of truth and justice." The disbarment of Dr. Kenealy is described as "a deed of transcendent villany" on the part of ten "wicked and obscure" men upon each of whom and on their posterity "the curse of God will fall for having plotted the destruction of Dr. Kenealy and his innocent children." In another passage we read:—"It is whispered that the whole of this plot was finally arranged at the Lord Chancellor's breakfast on Monday, when Cockburn, Mellor, Lush, Holker, Manisty, and Fook were present." Lord Cairns is acquitted of any personal participation in the conspiracy, but it is remarked that "the others are capable of any act of shame." Elsewhere it is asserted that "the Cabal would not shrink from imbruing their hands in Dr. Kenealy's life-blood, so deadly is their hatred of him and the paper with which he is connected"—which is perhaps an unintentional admission. Mr. Disraeli is exhibited as "the victim of a powerful cabal of aristocrats and Jesuits." The "vile Gladstone" is equally a Jesuit tool. In one number it is announced that next week there will be "a portrait of Chief Justice Cockburn, from Harper's (American) celebrated likeness, together with a Memoir of Chief Justice Jeffreys." When the Memoir comes, it is found that it places Jeffreys, while not extenuating his faults, in favourable contrast with his "modern imitators" on the Bench. "Jeffreys, Scroggs, Norbury, and Ellenborough," it is said, "were bad enough, but they were, as far as we know, free from these grand recommendations"—that is to say, a variety of villainies which in a previous sentence are imputed by innuendo to one or more judges now on

the Bench. Of course it is not known who wrote these disgraceful articles, but they were put forth under the sanction of Dr. Kenealy's name, and some of them bear a strong resemblance to passages in Dr. Kenealy's speeches as reported in the same pages. For instance, he is made to say at a Leeds meeting, after reciting several "dreadful things" which are alleged to have happened at the last Tichborne trial, "These things recall to us the horrible times of Scroggs and Jeffreys, and we cannot have Scroggs and Jeffreys on the Bench now, and we won't"; and in another part of the same speech he looks forward to the day when the police will pluck down the Chief Justice from his seat and carry him to Millbank, to be lodged by the side of the Claimant. At the meetings at which these speeches were delivered petitions to the House of Commons were adopted charging the Judges who tried the Claimant with having "lavished unheard-of and unprecedented insults on the Defendant's Counsel," and having done so "corruptly for the purpose of prejudicing and influencing the minds of the jurymen against the said Counsel," and generally with behaving in an oppressive, dishonest, and corrupt manner.

It is impossible to reproduce in all their literal foulness and brutality some of the calumnies which have week by week been directed by the *Englishman* against the Chief Justice and other public men; but we have quoted enough to show the general character of the publication. It was clearly improper, as the Lord Chancellor pointed out, that a Queen's Counsel should be permitted to use his official position for the purpose of circulating, and lending an apparent weight to, attacks and charges of this kind; and the same remark equally applies to Dr. Kenealy's position as a member of the Bar. A barrister, it must be remembered, enjoys a special monopoly of audience before the higher courts; and one of the reasons of this monopoly is that he is supposed to be under certain professional restraints and responsibilities which will prevent him from abusing the privilege. The right of free speech which a barrister possesses is a power of the most serious kind, of which, if there was no check upon its exercise, advantage might be taken in the most insufferable manner; and it can hardly be said that a person who is capable of acting as Dr. Kenealy has done is fit to be entrusted with so dangerous a power. Moreover, the Judges have also some claims to consideration, for, though it is perhaps too often forgotten, they are after all creatures of flesh and blood. No man with the slightest self-respect could tamely submit to be attacked in the way in which Dr. Kenealy has for some time been attacking Sir Alexander Cockburn and other Judges; and it is impossible to imagine a greater mockery than a counsel, fresh from declaiming to the mob in the street on the profligacy and corruption of a Judge, coming into Court to plead before the man whom he has just been denouncing. It is obviously an indismissible condition of pleading at the Bar that the pleader should assume the good faith and integrity of the tribunal which he addresses. The whole judicial system would immediately break down if counsel were to be permitted to pelt a Judge with any sort of dirt and stones they could find to their hands whenever they happened to be disappointed by losing a verdict. As a rule an advocate believes in his client's case, and has a grievance against a Judge who does not sum up in his favour; and very strong things are sometimes said on such occasions by suspicious and irritable men, but they have to be said in the ears of sympathetic attorneys, or in the confidential talk of the robing-room or the mess. It may be admitted that Judges, like other men, occasionally make mistakes, and that they ought not to be absolutely exempt from criticism. It is clear, however, on the other hand, that the criticism of judicial conduct must necessarily be performed with great caution and delicacy, and that, while it would be impossible to require a judge to submit quietly and without resistance to the most odious slanders both on his public and private character, it would be equally compromising to his dignity if he were liable to be drawn into a personal controversy with every violent and ill-tempered barrister who chose to attack him. No one who recollects Dr. Kenealy's outbursts of passion during the Tichborne trial can say that he did not fully deserve the rebukes he received from the Chief Justice and other Judges; but the Benchers of Gray's Inn were willing to overlook these irregularities on account of the allowance which they thought ought to be made for the difficulty and embarrassment involved in dealing with so exceptional a case. Dr. Kenealy, however, has carried his rancour beyond the trial, and has endeavoured by wild and reckless appeals to the mob to discredit the judicial body while seeking popularity for himself. This was a professional offence of the gravest kind which it was impossible for the Benchers to overlook; and as Dr. Kenealy persisted in repeating the offence, he left them no escape from the duty, not only of vindicating the honour of the profession, but of giving a warning to others who might be tempted to imitate his example. The Judges are not beyond the range of criticism, but there is a decent and proper way of doing everything, and Dr. Kenealy certainly did not choose this way in taking his revenge on those whom he regards as his enemies. Dr. Kenealy may now, if he chooses, try his fortune in publishing libels on the Bench as an ordinary private person; but it was clearly out of the question that he should be allowed to do so as Queen's Counsel and member of the Bar.

CRUELTY AT SEA.

A SAILOR'S life must always be more or less of a hard one, even in the best-found ships and under the most favourable circumstances. To say nothing of the element of danger, which is perhaps one of its redeeming charms in the eyes of men who are worth their salt, there must be a great deal of inevitable roughing it. Cold, wet, and weary watches come as a matter of course; custom and the force of habit enable the sailor to endure them with philosophy. As for that going aloft in all weathers which looks so ugly to a landsman, the sailor is supposed to take to the rigging as kindly as monkeys to the tree-tops; to be all hands and no head, and to be able to cling to anything and everything like a sucker-fish, with the knowledge that certain death is the penalty of a shortcoming in tenacity. And, so far as gymnastics aloft are concerned, habit does go for a great deal—under ordinary conditions. But the most active and sure-handed of men may well shrink from lying out on yards festooned with icicles, when the loosened sails would be flapping about him if they were not frozen into so much iron sheeting, and when they go swaying in the gale as if animated by demons with a special spite against him. The proverbial cherub that sits up aloft has his hands full in seeing to the life of poor Jack when the canvas is in that unmanageable state and the shrouds are slippery. If he could turn in comfortably between times, and had snug drying accommodation below deck, it would not be so bad. But in the swiftest of our ocean liners, owned by the most generous proprietors, he seldom has such luck. They are built for speed, and especially shaped for it forward. The pace at which they are propelled against wind and waves makes them extraordinarily wet. The steerage, so called *lucus a non lucendo*, is almost as often under the water as above it; seas are being perpetually shipped, and are washing down into the seamen's hammocks and bunks; so that the men necessarily live in drenched garments, and, unless they are fortunate enough to have an occasional spell of sun with a drying wind, they may run on through rain and tempest till there is not a dry stitch of clothing to be found among the crew. Our own experience as Sybarites of the shore should tell us how the temper is influenced by physical conditions. We should grow sulky towards the small hours if we had to sit shivering through the evening in damp clothes, and we should probably be warm in our language towards our servants if they brought us wet boots to wear in the morning. The seaman of course contracts with his eyes open to suffer these things, and, to do him justice, he is not much given to complain of them. Still, the necessity for submitting to them ought to give him some claim to consideration with good-natured officers, although implicit obedience and strict discipline must be maintained in every case. But if such is the seaman's normal life in ships which are fitted out with a liberal disregard of expense, what must be his condition in craft owned by needy, thoughtless, and selfish men? Not to speak of miserable accommodation and coarse and scanty commons, these smaller craft are almost invariably poorly manned and short-handed. Incapable hands, who are doubtless to blame for shipping themselves in such vessels, have to be always attempting the impossible; men who are more competent have to do the work of their messmates as well as their own. In either case it must rest with the captain and his officers whether the ship shall be a place of tolerable comfort and happiness or "a floating hell." At sea the captain is apt to fancy that he is almost irresponsible, and it is only just to remember that he has often standing cause for irritability. It is he who has to take thought for the safety of the ship, as well as for the speed with which the voyage is got over. Sent out to sea perhaps with a wretched lot of men, he finds himself expected to make bricks without straw; only, unlike the oppressed Hebrew, he has the absolute authority of the taskmaster. As day after day goes by with his difficulties thickening about him, a temper which may never have been sweet grows gradually sourer. Possibly he has been knocked about himself in his time, and experience of cruelty and injustice has hardened him into a tyrant. In his way, commander as he is, he is as little provident of the future as any of the seamen rated on his books. He vents his ill humour every hour of the day without speculating on the probabilities of retribution. Perhaps, were his conscience more lively, it might conjure up the vision of a dock in a criminal court, with victims or accomplices summoned to give evidence against him, and then he might muster sufficient self-control to hold his hand. But as his torpid imagination suggests nothing of the kind, he throws the rein to his passions. He nurses pet enmities, and indulges them; he orders the application of the cat in season and out of season—nay, in the rough and ready fashion of the school that turned cabin boys into Sir Cloudeley Shovels, he snatches at the weapons that come most readily to his hand, and lays about him unmercifully with handspikes and belaying-pins.

That many ships' crews are disciplined in this way is only too certain. We need scarcely say that we are no apologists for cruelty, and if we have dwelt on the excuses that may be urged for irascible and overbearing captains, it is only because these must necessarily operate to secure an unfortunate immunity for much brutal violence. Law and common sense will always, within certain limits, incline to make allowances for a man isolated from all legal support, controlling some scratch crew which may often be an awkward lot to deal with. To say the least of it, the men may frequently be made of much the same materials as their

captain, and if they were not ruled firmly, and almost roughly, they would inevitably get the upper hand and keep it. Amidst charges and counter-charges, with much cross-swearings, it may be difficult for a jury to decide that the man in power went over the line which divides necessary firmness from wanton cruelty. Unless strong cause has been shown to the contrary, the judge will naturally be disposed to support authority. Consequently, even were violent merchant captains brought much more frequently to the bar than they are, we should expect often to see them either acquitted or dismissed with a reprimand, when in reality they had been labouring hard to incur exemplary punishment. It is for this very reason that we would have justice dealt out unsparringly when deliberate, wanton, and systematic cruelty appears to have been clearly established.

Having said so much, we need hardly add that the immediate text for our remarks is supplied by the case of the captain of the *Emily Augusta*. We may presume our readers to be so familiar with its details that it is unnecessary to dwell on them. Walters was not guilty of a single death, but of several. Even if the *Lascars* were as incompetent as he says they were, that could hardly have been admitted even as a palliating circumstance. He did not dispose of a man with a single blow, or with a beating given in a paroxysm of uncontrollable rage. He subjected at least three of his crew to a course of unremitting and ingenious brutality, until at last the helplessness to which he had reduced them was so conspicuous that the commonest prudence might have counselled his leaving them alone. Yet he continued his malignant tortures through their fatal illnesses to their dying hours. His desperate attempt at a defence only aggravates his guilt. He had the audacity to plead that in reality he had been the kindest friend of his victims; as if a man who had a spark of mercy in his composition would have forced an expiring wretch from his bed to go about his ordinary duties. He urged the filthy habits of the *Lascars* as adequate justification for killing them by torture; as if men covered with wounds and suffering from open abscesses could have kept themselves clean, however much they had desired it. The jury thought fit to define the offence as manslaughter, and accordingly Walters has escaped with fifteen years' penal servitude. We cannot but regard this finding as most unhappily lenient, considering how clearly the case had been proved, and how seldom such an opportunity arises for making a signal example. Had Walters consummated a quarter of his crime on shore, we doubt whether he would have escaped the gallows. This case of the *Emily Augusta* involved several "manslaughters," and there was another which was brought last week before the magistrates of Lynn, which seems to us to tell, if possible, almost more strongly against the culprit. It is true that he did not kill anybody outright; apparently because, being only in command of a coasting craft, he had not the time. But he was convicted, among other atrocities, of tying a rope to a man's wounded hand, and "amusing himself" with tugging at it at intervals. When asked what he had to say for himself, he answered that he did it "for a lark." The Mayor of Lynn thereupon remarked, with natural indignation, that "it was the greatest piece of cruelty he had ever heard of"—and condemned the criminal to pay a fine of ten shillings with expenses. After this we suppose we must congratulate ourselves that the captain of the *Emily Augusta* has earned a sentence of fifteen years. Considering the habitual brutality practised on victims who are practically helpless, considering the inevitable rarity of prosecutions and the extreme difficulty of obtaining convictions, misplaced leniency, when offences are clearly made out, seems to us equally culpable and deplorable. It is not a pleasant reflection that such a man as the rufian who figured before the merciful magistracy of Lynn is perfectly free (if he can find employers) to practise similar "larks" on other unfortunate victims, provided he can afford to pay ten shillings for the sport. Before dismissing the subject, we may make one remark suggested by the deaths on board the *Emily Augusta*. Surely it is undesirable in any case to employ Indian seamen on voyages that carry them into the climate of our Northern winter. Swathed in wrappings and flannels, they could hardly discharge their duties to the satisfaction even of captains far less arbitrary and exacting than Horatio Walters; and if they are not protected against wet and cold, existence must be a living misery to them.

REVIEWS.

STREET'S BRICK AND MARBLE IN ITALY.*

A GOOD many years have gone by since Mr. Street published the first edition of his *Brick and Marble in the Middle Ages: Notes of a Tour in the North of Italy*; and he would no doubt have been, as he well deserved, reviewed by us, had his literary birth not preceded our own by a few months. This year witnesses the publication of an enlarged second edition of his volume, with the substitution of the plural "tours" on the title-page, and of the initials R.A. for the less select F.S.A. This book in its first form appeared at an opportune time, for public curiosity had been awakened by, but not sated with, that which was to most Englishmen practically the discovery that, as during the middle ages

* *Brick and Marble in the Middle Ages: Notes of Tours in the North of Italy.* By George Edmund Street, R.A. Second Edition, with numerous Illustrations. London: John Murray. 1874.

Gothic architecture had grown up, flourished, and then faded away north of the Alps, exhibiting during that period different phases by which the work of the respective centuries could be distinguished, so it had run a parallel course in Italy; and that, as in other countries, so in that it had been all through its course stamped by national characteristics. It is not so long since it was the fashion even of educated persons to talk of Milan Cathedral as if it were almost a unique example of an exotic method of building in Ultramontane lands. The first English writer who embodied in systematic language the fact that a distinct school of Italian pointed had existed was undoubtedly Thomas Hope; but his *History of Architecture* was a posthumous work, and the same year, 1835, which saw its publication was also enriched by Professor Willis's careful and acute *Remarks on the Architecture of the Middle Ages, especially of Italy*. Pugin's pilgrimage to Rome was unfortunately only fertile in sketches which long remained unpublished; while the descriptions contained in Mr. Webb's *Continental Ecclesiology* were destitute of illustrations, and Gally Knight's sumptuous volumes were only the contribution of an enlightened amateur. At this epoch Mr. Ruskin's *Seven Lamps* and his *Stones of Venice* successively appeared, with their minute multiplicity of individual descriptions to stimulate the artistic appetite for some more rapid appreciation of a wider range of Italian Gothic examples. Mr. Street had the good fortune at that moment to present himself, with not too much matter, and with his modicum well served up. His book was not an essay but a tour, occasionally breaking into descriptions of scenery, which were both precise and picturesque, or little incidents of personal experience, but never losing sight of the main object for which the journey had been undertaken, while it was plentifully illustrated by what were to the general public the first fruits of Mr. Street's masterly pencil. An undertone, too, of genial defiance which ran through the more artistic portion of the volume fell in very seasonably with the temper of the class of readers for whom the work had been particularly written.

The Gothic party among our architects, together with its unprofessional backers, was still labouring under the unpardonable defect of youth; and its members had been subjected a little too long for patience to the pompous patronage of Academic dons, who were never tired of exhorting their "young friends" to befake themselves to the classic soil of Italy, and there at the fountain-head contemplate the masterpieces of pure taste. Platitudes were well met by defiance; and a tiresome controversy was opportunely cut short by producing a foremost champion of the mediæval cause, who could return from the sacred journey with head and notebook full of fresh phases of the proscribed style. The "Brick and Marble" which filled the first line of the title-page was a lucky hit at the moment when Englishmen were awakening to the fact that shabby stucco was a bad substitute for honest red brick, while the railroad, the steamer, and the steam-saw had essentially cheapened the use of that class of close-grained stone which is indiscriminately described as marble. No doubt the lessons taught by Mr. Ruskin and Mr. Street bore a crop of first fruits in an experimental imitation of features of Italian Gothic by several of our architects which sometimes betrayed a forgetfulness of the different climatic conditions of lands respectively washed by the Mediterranean and the German Ocean, and a contempt for national traditions akin to that which Gothicists are apt to charge against the followers of the classical school. The fashion was one out of many in an age of eclecticism gone wild, and those whose talents would have made their permanent adoption of Ultramontane pointed most detrimental to the development of an architecture which should be at once natural and national, have had the sense to pull up, and—while engrafting on the certainly more noble forms of Northern Gothic details of ornamentation borrowed from Southern types—to work out their ideas in loyal conformity to the requirements of indigenous art. Apart from the modern craze for the so-called Queen Anne style which has possessed some who were once amongst the most rigid Gothicists, the reaction in favour of the historical continuity of our national architecture has characterized the works of our best men during the last few years. Still this incident is no reason, but the contrary, why the science of architecture should not rest upon a wide inductive study of comparative examples.

The brick and marble churches or palaces of Northern mediæval Italy may no longer be a revelation of an almost unknown phase of art; but they are established facts as to which the student of the science of building cannot now be permitted to plead "invincible ignorance." It was accordingly quite worth Mr. Street's while, if he still adhered to the positions laid down by his more youthful pen, to reprint his book. But in the years which have elapsed since its first publication he had made more than one raid across the Alps, both widening his acquaintance with ancient models and enlarging his share of pleasant traveller's gossip. Still he could not bring himself absolutely to recast the work by which he first became known to the wide circle of general readers, and he has accordingly adopted the somewhat intricate expedient of reproducing the continuous record of his original journey, and at the same time profusely intercalating the book with matter picked up on subsequent occasions. This is of course a detriment to its literary completeness. Still, as the value of the architectural portion of the volume is of a far more solid character than that of its tourist digressions, we need not be very fastidious about an arrangement which has enhanced its value as a scientific exposition at the expense of the consistency of its narrative. The extent of the additions may be estimated

by the fact that the chapter devoted to Venice in the first edition is enlarged by more than half as much again now; matter; while Vicenza, Aquileja, Udine, Ferrara, Bologna, Modena, Parma, Piacenza, and Verocelli appear for the first time in the table of contents as visited, described, and illustrated. Mr. Street informs us that it has been his happiness to revisit the quaint old town of Como again and again since he wrote the description of it which he reproduces from his first edition. We are therefore rather surprised that he should still have overlooked the exceedingly interesting church of San Abbondio. In 1855 Mr. Street triumphantly boasts that he "stayed not" at Vicenza as one of a "school of artists" "young and earnest, fighting for truth, small in numbers, disciples of nature, &c.," and therefore pledged antagonists of another and a naughty school, who were just the contrary, and worshipped Palladio. In 1874 this comparative description of the two parties is repeated, although the "young" is not quite so true, while, thanks to the ability and honesty of such as Mr. Street himself, the "small in numbers" is no longer accurate in any sense; but the "gag" now leads up to the statement that "I stayed not longer at Vicenza than was necessary to satisfy myself of the truth of the charges against Palladio's work there, and to note the few, but interesting, mediæval remains." It must be confessed that he makes out a good case against Palladio, whom he cannot forgive as an "artist who did not care to give solidity to his work, and" (for?) "the power of executing a vast amount of enrichment in the cheapest way and with the commonest materials is about the greatest snare into which an architect can allow himself to fall." The defence which Mr. Street proceeds to offer for Palladio from the "trumpet modes of construction" found at Pompeii is ingenious, for, as Pompeii was not discovered till nearly two hundred years after Palladio's death, the excuse is in fact a further charge against the favourite style of the opposite party, both in its ancient and in its modern manifestation.

The description of the Patriarchal Church of Aquileja, once "one of the greatest of the old Roman seaports," but possessing "now only a few poor houses and a sparse population, pauperized and inviolated by fever and swamps on any side, whilst the sea has retreated some three miles," is very interesting. We make two extracts as illustrating a fact to which the recent discoveries at San Clemente at Rome bear remarkable evidence—namely, the lateness of the date down to which the basilican arrangement of churches was preserved and repeated in Italy:—

The one great interest in the city now is the cathedral. This is a great cruciform basilica, with a central and two small apses east of the transept, and eleven arches between the nave and aisles. The arrangements of the apse are interesting; two flights of steps lead up to it from the nave, and in the centre of the east wall is the patriarch's throne of white marble, well raised on a platform above the seat which goes round the apse. The whole arrangement is singularly well preserved, and looks very well, in spite of the destruction of most of the mosaic pavement with which originally no doubt the floor was laid, of which only a few tesserae now remain, and in spite also of the modernization of the rest of the apse. This throne appeared to me to be not earlier than circa 1150, though the church is said to have been built between 1019 and 1042. These dates must, I think, be taken with large allowance for alterations. With the exception of the apse and the crypt under it, I believe the greater part of the church was rebuilt in the fourteenth century; for though the Roman capitals (which were everywhere ready to the hand) were used on the ancient columns, the arches carried by them are pointed, and the clerestory is evidently of the same age. This combination of classic columns and sculpture with pointed arches is so very unusual that it is quite worth while to give an illustration of the interior. The columns, capitals, and bases are of varied shapes and sizes, and evidently a mere collection of old materials which happened to be handy for the builder's use; the arches are rudely moulded, and the clerestory of cinquefoiled windows, each of a single light, is as insignificant as possible, and yet withal there is so grand an area enclosed that the effect is good and impressive. The nave is divided from its aisles by eleven arches on each side, and measures about one hundred and fifty feet in length, by one hundred and five in width. The aisle roofs are modern, but the nave still retains its old roof, a fine example of a cusped ceiling, boarded and panelled in small square panels. The whole of this ceiling is painted, and with extremely good effect, though the only colours used are black, white, and brownish yellow. Each panel is filled with a small painted hexagon filled with tracery painted in black and white, and all the ribs and leading lines are yellow and black. The purlins, which are arranged so as to form the points of the cusps, are very decidedly marked with black. Simple as the treatment is, the effect is admirable, and it appeared to me to be owing to the large amount of white in the panels. Near the west end of the north aisle is a singular circular erection, which is said by the cicerone to be the receptacle for the holy oil, but which without this information I should have taken for the baptistery.

The interior of the eastern part of the church is more interesting than that of the nave. It is all probably of the original foundation, and retains most of the old arrangements. The floor of the choir is raised some ten or twelve steps, with two flights of steps on each side of the centre. At the top of these steps, projecting sideways into the transepts, are tribunes with open balustrades which seem to have served as ambons. The apse has two rows of seats, with the patriarch's seat raised in the centre, and the altar stands in front of this on the chord of the apse. It is curious that this, which is an apse internally, is a square projection from the transept externally.

A descent on each side under the tribunes leads to the crypt under the raised choir. This is very small, but is divided into three aisles in width, and four bays in length. The central space is screened round jealously with close grilles reaching from floor to vault, so as to protect the shrine of S. Hermacora, which occupies the centre. But little light steals into this crypt, and that little has to find its way between rank weeds which grow up round the windows; but there is quite enough to reveal vaults covered with paintings of subjects, and to show as picturesque and beautiful an ensemble as one need wish to see. Kneeling-deaks were placed round the shrine, but the cultus of S. Hermacora seems to be no longer popular, and the only pilgrims are curious visitors like ourselves. The paintings on the groining appeared to me to be of not earlier date than the fourteenth century, and are very cleverly contrived to suit the early vaults.

The transepts remain to be mentioned. Each has a small eastern apse

near the extreme end, and a tomb or shrine between this apse and the choir tribune. These are of the thirteenth century, and are enormous blocks of stone, panelled and carved in front, and supported on four detached shafts. In the south transept there are fragments of a Byzantine screen round the altar in the small apse, which are of rare beauty and intricacy. The screen consisted of a solid base, breast high, covered with carving, and upon which columns stood originally at intervals of six feet, just as in the screen at Torcello, of which I have given a view.

There is an early painting of Our Lord, seated on a throne, in the semi-dome of this apse, and there are remains of an early wall painting in the choir-apse, partly covered by a fifteenth-century picture in a good frame. The choir stalls are of elaborate intarsia work, and date from the end of the sixteenth century.

A little way to the north of the church stands its campanile, a tall plain mass of masonry, with the date MDXLVIII. on the upper stage, and the inscription "*Tadeus Luranus hoc o. fecit.*"

The Gothic church of San Petronio at Bologna was in its conception about the largest church in the world yet thought of, not excepting the Abbey of Cluny or St. Albans, while it would have exceeded in length, and in breadth fallen not much below, the actual St. Peter's; for it was to have been 800 feet long and 525 across the transepts, with a central dome 130 feet in diameter, and even the fragmentary nave, which is the only completed fragment of the gigantic enterprise, is more than 300 feet in length:—

The grandest church in Bologna is undoubtedly San Petronio, which is well placed on one side of the Piazza Maggiore. It was not commenced until 1390, so that we must not be surprised to find the faults in detail which mark the period. But the general scheme of the church is so magnificent that those faults do not strike the eye at all offensively. As it stands even now, with only its nave and aisles finished, it gives a vast idea of size and space, though this is hardly appreciated at first, owing to the enormous dimensions, the fogginess of the parts, and the extreme simplicity of all the details. The west front is of immense size and width, but its only finished parts are the plinth and doorways, the whole of the rest being left in rough brick. The detail of this finished part is of poor character, and later than the fabric. It is rather richly carved with figures, which are sometimes much praised, but which seemed to me (with the exception of a *Pieta* over the south-west doorway) to be of poor style and character. Going round to the side of the building, the design is of earlier date and much more interesting. The aisle-windows are noble designs of four-lights in each bay, separated by buttresses and surmounted by steep-pitched gables. The detail is an extremely good combination of brick and stone, whilst a magnificent plinth of stone and marble gives great force to the work. The transept was never built, but at the point where it was intended to be connected with the aisle there is a curious conceit—a window at a projecting corner with half its arch and tracery facing south, and the other half facing west. It is, so far as I remember, a unique example in a church, but is just a little like the angle-windows in some of the Venetian palaces, though there is never indulged in such an absurdity as is the construction of two halves of pointed arches over such an opening.

The interior is very magnificent. The columns, arches, and walls are generally are of brick, now coloured and whitewashed (but originally intended to be seen, as is evident from parts of the incomplete work where the internal brickwork is still exposed and is executed with the greatest care), the capitals and bases being all of stone. The columns of the nave are bold clusters; they are about sixty feet from centre to centre, rather short in proportion to the height of their capitals, which are carved with stiff foliage. Above there is a large pier running up to carry the groining, and there are pointed arches opening to the aisles of very lofty pitch, but which, owing to their great size, certainly look very attenuated. Two chapels open into each bay of the aisle; these are lighted by the large four-light windows already mentioned, whilst both nave and aisles have no windows except cusped circular ones of no great size, placed as near as possible to the groining, which is very simple throughout the church. There is scarcely a horizontal stringcourse or a label to be seen, and the mouldings are few and simple; yet, nevertheless, the effect is grand. Such a church may well trouble the mind of the English student who thinks that no building is complete which has not its arcade, its triforium, and its clerestory. One of our puny churches would stand—nave, aisles, chancel, tower, and spire and all—within one of the bays of the nave and aisles here; and there is a grand sense of restraint and simplicity about this work which impresses me more each time I see it. At the same time the interest is of this grand kind—there is a sense of the immense and infinite, but no condescension to the love of detail and delight in dainty variety, which undoubtedly strikes us in most good Gothic works, and makes them so enjoyable.

The church which inspired the design of this was, no doubt, the cathedral at Florence. But of the two the design of San Petronio seems to me to be the more beautiful. The addition of chapels beyond the aisles and the traceries in their windows make the design a little less bald and insipid, and also give a somewhat truer impression of the real scale than one has at Florence. But at the best such work does not create enthusiasm. The principal effort of the architect was to build something very big, and he succeeded; unfortunately he so contrived as very nearly to prevent one from quite realizing how vast his work is, and I hardly know a more serious charge that can be made against an architect than this.

The characteristic conclusion with which the author in 1855 summed up the lessons which he desired to enforce from his Italian tour has been partially re-written in the re-publication, and it now appears in the following shape:—

Finally, I wish that all artists would remember the one great fact which separates by so wide a gap the architects, sculptors, and painters of the best days of the Middle Ages from us now—their earnestness and their thorough self-sacrifice in the pursuit of art, and in the exaltation of their religion. They were men who had a faith, and hearts earnestly bent on the propagation of that faith; and were it not for this, their works would never have had the life, vigour, and freshness which even now they so remarkably retain. Why should we not be equally remembered three centuries hence? Have we less to contend for, less faith to exhibit, or less self-sacrifice to offer than they, because we live in later days? Or is it true that the temper of men is so much changed, and that the vocation of art has changed with it? I believe not. There have been evidences enough that there is no lack of liberality on the part of our employers, where there is any evidence of skill and enthusiasm for his work on the part of the artist. The English architect of to-day has opportunities as great as those of any of his predecessors, if he will but use them. But he must use his art as one who respects both himself and it. There is no real respect for an art when it is treated, as it always has been by the Renaissance architects and their followers, as a mere affair of display. No good building was ever yet created in which the architect designed the front, and left the flanks or internal courts to take

care of themselves. So also no good building was ever seen in which the exterior only was thought of, and the internal decoration and design neglected. But this is almost universal now, except in the few buildings in which the Gothic style has been carefully revived. In such treatment of art as this there is an ingrained falseness, which is as demoralizing as it is ruinous. If architecture is only an affair of outside display, no one will take any real interest in it, for from the first it is the evidence of the architect's love for his work which has given the human interest which is all in all to it.

It is this truthfulness only, in every line and every detail of every part of a building, which can ever make great architecture—it is this only which one would wish to extract from the works of our forefathers—and this only which I have desired to discover in the works of those Italian artists whose labours I have been considering, and whose efforts I have endeavoured to set before my readers; and it is this desire which can alone be my excuse for having undertaken the work which I have now brought to a conclusion.

While we accept the general principles which lie under Mr. Street's earnest protest, we think that he has done less than justice to the influence of his own party in fostering the improvement of our national architecture in the important considerations of reality and thoroughness outside of the dominion of the actual Gothic school. We agree with him that the earliest and foremost advocates in our times of these architectural virtues, and the most outspoken foes of all constructional shams, were the pioneers of mediæval art such as Pugin and Mr. Ruskin, the fighting men of the Oxford and Cambridge Societies, and himself. But the same fate has befallen these champions which is common enough in the history of all successful causes. They have been so much more persuasive than they ever expected to be, that they have actually made half converts of the men to whom they are still bound by the sacred ties of party to vow eternal hostility. It is just like the case of politics or any other large public interest. When the Liberals behold a Tory Government serenely marching along the path of Free-trade and Reform, or the Tories are awakened up by the Liberal leader's war cry of "Our Protestant institutions in Church and State," the dictates of true Christianity ought to make each side rejoice over the conversion of egregious prodigals. But somehow such returns to the paths of rectitude, if they happen to lead across our neighbour's fields, are too often met by reference to the fellows who stole the boys' clothes while they were bithing, or some other unmannerly remark of the same kind. It is the same in art. Those writers on the Gothic side had a double task to perform—to prove the existence of an architectural conscience embodying reality of design, material, and construction, and to vindicate for the principles of Gothic that they most naturally led to the manifestation of these realities. In so doing they hit faithless friends as hard as open foes, for the Gothic of Strawberry Hill, or the old House of Lords, was as full of dimmy shams as any terrace in the Regent's Park. Naturally enough their success was different with different men, and, as Cobden has made all political parties the enemies of monopoly without their ceasing to be Tories or Liberals, so Pugin has made all artistic schools advocates for reality without their ceasing to be Italians or Goths.

It is still open to Mr. Street to contend that the good which all equally desire can only be satisfactorily reached by the highway of Gothic; he is hardly justified, however, in still asserting that those who travel in another direction are not desirous themselves of the same good. For instance, to take the illustrations which he himself offers, is Gothic now the only style in which the architect himself does more than design the front and seems to leave the flanks or internal courts to take care of themselves? Is it the only style in which now the exterior only is not thought of, nor the internal decoration and design neglected? We venture to test the truth of these imputations by a reference to the class of buildings in which, next to churches (in which the Gothicists carry all before them), our modern architects of all schools, except it may be the pure classical, have had the fairest field to show off their respective capacities; we mean those costly country houses which the vast growth of national wealth, with the accompanying demand on the part of our men of money for art of some kind, has scattered over the land. Whatever may be the merits on the whole of these various buildings, we should have thought that their faults would have generally been acknowledged to lie in the contrary direction from those which Mr. Street scathes. There are many of them of which "all front and no back" might be truthfully predicated, while the gorgeous oppressiveness of their internal arrangements and decorations would occasionally lead us almost to regret the bald simplicity of our grandfathers' plastered villas. The disciples of Phidias (if any such survive), who are the only school of architects whom modern fashion has left nowhere, might now retaliate by recalling the forgotten merits of rhythmical proportions, pure outline, and delicate detail, to the vacillating consciences of those backsliding Gothicists who have suffered themselves to be ensnared by the capricious picturesqueness of the Queen Anne builders. To their seductions Mr. Street has always loyally closed his ears.

PROFESSOR MASSON'S CHATTERTON.*

CHATTERTON is decidedly not enough to make a monograph of. Assuming, however, that a monograph was to be written at all hazards on Chatterton, Professor Masson has smoothed over the

* *Chatterton: a Story of the Year 1770.* By David Masson. London: Macmillan & Co. 1874.

impossibility as neatly as it could well be done. If one regards his book merely as an ingenious exercise, showing how far a very small subject may be beaten out by a practised hand without using actual violence to it, there is much to admire in the art he has shown on the present occasion. Why he chose this particular exercise, having, in virtue of his office, the whole field of English literature before him, we have no means of determining, and it would be idle to guess. Perhaps, however, we should look for the explanation rather to that other part of his office which deals with rhetoric, for a Professor of Rhetoric, we presume, may well teach the figures of speech by example as well as by precept, and we find that the means by which the very meagre outline of Chatterton's life is filled out to 280 pages are mainly reducible to three or four figures or methods of speech. These we may take leave to call the method of *The time when*, the method of *Reader!* the method of *If*, and the method of *Ah!* They are of course not intelligible without a specimen; and as in practice they are not all used at the same time, we must try what we can do in the way of putting them together by ourselves, working in a fragment from the original where we find opportunity. Nor is there any occasion to digress from our subject, since the method will serve for any subject equally well. We have only to suppose ourselves writing "a story of the year 1874" about Professor Masson's monograph:—

"Was there ever a time when there was not a present crisis, or at least an anti-crisis? Well, at this time there was an anti-crisis in England. It was the time when a Premier who had solaced the hours of opposition by dreaming of ropes of pearls could turn his versatile magniloquence to the adornment of Imperial facts, and boast that he had added a Fijian jewel to the crown of England. It was the time when most men in England were in their mood of rest, as you and I, reader, have been or doubtless will be. Most, we said, but not all; for meanwhile an ex-Premier, shot as it were into space and silence by the recoil of his own engine in that surprise in a time of surprises, the general election of 1874, was already refreshed for new battles. Busily and silently he was forging the polished thunderbolt that should burst upon the Ultramontane hierarchy as from a clear blue sky. Ah, the poetry of coincidences! While this one was forging his thunderbolt, another was weaving a tiny laurel-wreath. Reader, were you over in Edinburgh? If so, you may know in what sort of place this labour of love was being done; or, if not, you may read about it in a guide-book." Here may follow a description of Edinburgh *ad libitum*. "Nor was the task of telling Chatterton's story so light a one in those days. If only it had been reasonably long and moderately eventful, if only any of those contingencies had been realized on which the biographer so fondly dwells; if only the marvellous boy had been taken up by Horace Walpole or rescued by Goldsmith, or had run away from Bristol with Hannah More and lived happy ever after, how much less desperate would have been the writer's task! But now with all his cunning and goodwill how should he tell a story when there was no story to tell? Ah, how indeed?"

We fear, however, that this may seem exaggerated, and on second thoughts it seems best to give one or two authentic fragments by which the reader may check our humble imitation. Here is one of the paragraphs which begins with Oh!:—

Oh! the weariness of those aimless walks of a young literary adventurer, without a purse or a friend, in the streets of London! The perpetual and anxious thought within, which scarcely any street-distraction can amuse; the listlessness with which, on coming to the parting of two ways, one suffers the least accident to determine which way one will take, both being indifferent; the vain castle-building in sanguine moments, when thousands of pounds seem possible and near; the utter prostration of spirit at other moments, when one inspects the shivering beggar that passes with new interest as but another form of one's self, and when every glimpse of a damp, grassless churchyard through a falling acts as a horrible premonition of what may be the end; the curious and habitual examination of physiognomies met as one goes along; the occasional magic of a bright eye, or a lovely form, shooting a pang through the heart, and calling up, it may be, the image of a peerless one, distant, denied, but unforgettable, till the soul melts in very tenderness, and all the past is around one again; the sudden start from such a mood, the flush, the clenched hand, the set teeth, the resolve, the manly hope, the dream of a home quiet and best after all with one sweet presence; and then, after that, the more composed gait, and the saunter towards the spots one prefers, till the waning day, or the need to work and eat, brings one back fatigued to the lonely room! And so from day to day a repetition of the same process. Ah, London, London! thou perpetual home of a shifting multitude, how many a soul there is within thee at this hour, who, listening to that peculiar roar of thine, which shows the concourse of myriads in thee, and yet feeling excluded, like an unclaimed atom, from the midst of thy bustle, might cry aloud to thee, "I, too, am strong; I am young; I am willing; I can do something; leave me not out; attend to me; make room for me; devise the means of absorbing me, and such as me, within thy just activity; and defer not till I and they make thee hearken with our shrieks!" But London rolls on; and men, young and old, do demand impossible things. If it is impossible to make the medium without conform, some power is at least left to shape and rule the spirit within.

And here is an extract showing two of the other methods. It must be understood that it immediately follows two pages and a half of the miscellaneous contents of the newspapers for April and May 1770:—

It was into the midst of such incidents as these, episodic as they were to the two great topics of Wilkes and the Constitution and the growing disaffection of the American Colonies, that Chatterton transferred himself by his removal from Bristol to London. With some of the little incidents mentioned he may even have come into direct personal contact. If he did not go to see Addison's tragedy of *Cato* at Covent Garden on the 30th of April, it is not likely that he missed the opportunity of seeing Garrick in *Hamlet* at Drury Lane on the end of May. If the "fine sight" of the

lady of high quality with the hundred thousand pounds' worth of jewels about her, and the three young negroes supporting her train, did not tempt him to the vicinity of the Foho Masquerade on the evening of the 7th of May, it is not at all improbable that he formed one of the crowd that gathered round the door of the House of Commons that evening on the false expectation of seeing Wilkes come to make a scene and get himself committed to custody by the Speaker.

It must be observed that Professor Masson is not to be accused of book-making in the ordinary sense. He has been at much pains to verify all the relevant facts concerning Chatterton's life and life-time, and not a few irrelevant ones. He is indebted, as appears by his handsome acknowledgment, to another ingenious writer for the correction of the number assigned by tradition to Chatterton's lodging in Brooke Street, Holborn. But he seems to have spent some time in walking up and down Shoreditch to see which house looks most like that in which Chatterton first lodged on his arrival in London. The search has indeed not led to anything beyond an "incommunicable impression" of its general whereabouts, the only fixed condition of the problem with our present knowledge being that the chosen house "shall be conceivable as having once been the abode of a plasterer." A more definite search has been made in the *Gentleman's Magazine* for 1771, by means of which it is ascertained what sort of weather it was in 1770 when Chatterton set out on his journey to town from Bristol. We have the names and characters of all the people Chatterton knew, most of those whom he may reasonably be presumed to have known, and some of those he did not know. To the last class belongs Hannah More, then living at Bristol, who comes in by way of unrealized contingency, as we have already mentioned. We are also told with some minuteness how Dr. Johnson and Goldsmith spent their long vacation in 1770, and with brief regret that it is not known where Garrick, Burke, Sir Joshua Reynolds, and the rest of the Club spent it; the connexion of these distinguished persons with the story of Chatterton being simply that none of them heard of him till after he was dead. There is also, as we have hinted, a great deal of miscellaneous information as to what was happening in London from month to month, and amongst these incidents the contest between the City of London and the King in the matter of Wilkes is told with considerable spirit. This last no doubt is fairly relevant to Chatterton, inasmuch as he sought to make capital out of it as a political writer, and might possibly have done so if it had not been for the Lord Mayor Beckford's unexpected death. In short, Professor Masson has collected with much diligence and sufficient discretion the materials for an historical novelette. The materials are excellent, and, as far as we can see, much more trustworthy than those which novel-writers generally use. Unhappily Professor Masson has not written the novelette, and the matters which in a work of fiction would be most useful as the groundwork of dialogue and incident are out of all proportion in a professed biography, at least when there is so little biography to support them. There is one book of George Sand's consisting simply of rough notes for an historical novel which was never executed; it contains curious facts, but in a literary point of view it is quite dull enough to be a warning. Professor Masson's notes are indeed not rough, for he has given them more polish than they will bear. But, in short, the whole thing is an elaborate trifle of a kind which Professor Masson's skill in execution enables him to make passable enough, but which in the hands of an inferior workman would be quite intolerable. It is a dangerous example to youth, and one which it is perhaps hardly desirable that a Professor of English literature should set. In the style also there are things which we should not advise students of the English language to imitate. Those who speak of an "attempt to teach a certain class of animals the value and beauty of pearls" will not be on the right way to refined sarcasm, and those who use "function" as a verb will commit themselves to a more than questionable Gallicism.

Concerning the nucleus of real biography in the book (which after all is but a cometary sort of nucleus) there is very little to be said. Not so much play is made with the discussion of Chatterton's character as might have been looked for, and so far there is reason to be thankful. Professor Masson repudiates somewhat warmly the supposition that Chatterton was insane in the ordinary sense, yet he seems to think he approached insanity in some less ordinary manner; for he proceeds to tell a story from a Scotch newspaper of an idiot who worshipped the bell of a ruined parish church, and he suggests that Chatterton may have entertained the same kind of fetish-worship in a milder form for the church of St. Mary Redcliffe at Bristol and its contents. These contents included a muniment-room and apparently some real muniments, of which however no further account is now to be had than the compendious negative familiar to maritime commerce, "weight, value, and contents unknown." Professor Masson thinks Chatterton may have got some suggestions of fact from them. Given these conditions, a precocious imagination, and a disposition which Professor Masson calls first "a remarkable veneration for the antique," and then still more tenderly "a preference for the antique in form," and the result was the Rowley MSS. However, the epithet is just, for that may well be called a remarkable veneration for the antique which displays itself in impudent forgeries. For, notwithstanding all the sentiment that has been spent on Chatterton, these productions claim our admiration chiefly as a masterpiece of impudence. Apart from the internal evidence, which was not quite so glaring then, except to a few scholars, as it is now, they were self-condemned by the suspicious circumstances and the imprudent haste of their production. Horace Walpole believed in the first

specimen Chatterton sent him, but doubted on a second reading:—

A series of Anglo-Saxon painters till then unheard of; a new poet of the twelfth century writing a poem on Richard I. in perfectly modern metre; and a new poet of the fifteenth, advertised as having left numerous poems and other writings still extant in Bristol; all this in one letter was too much; . . . But, when the second letter came, bringing with it a batch of new painters, and specimens of two Saxon poets of the sixth century, and when in this letter the writer explained that he was a poor widow's son with a turn for literature, there could be no longer any doubt in the matter.

One wonders how Walpole believed even on a first reading. The biographer, as in duty bound, says the most he can for the merits of his hero's poetry. He does not indeed claim much beyond fluency and smartness for that part which was written in the current language of the day, and certainly the specimens he gives are poor and flippant enough. On behalf of the false antiques, however, he rises to something like enthusiasm, and asserts that at that particular time Chatterton "was, with all his immaturity, almost solitary in the possession of the highest poetic gift." To our mind, it would take a much greater genius than Chatterton's to carry off the falseness of a diction in which antique forms and words, even when correct, are mixed up in hopeless anachronism, and crudely thrust into modern thoughts and phrases. But we leave the reader who cares to form his own judgment on this to seek the materials in the last chapter of Professor Masson's book.

THE BERLIN HISTORY OF THE CIVIL WAR IN AMERICA.*

IT is a strange chance, if indeed it really be a chance, that we should hardly have done reading the Count of Paris's volumes on the American war when we find before us the rival work from Berlin. It has been known for some time past that the library of the General Staff Bureau at that capital was to have an independent book of its own on the great contest which Count Moltke has been too hastily charged with slighting; and the title thoroughly explains the main object of the work confided to Major Scheibert, which is to offer to every German officer a clear narrative, handy in size, and framed so strictly with military objects as to give him all the chief professional lessons to be drawn from it, without pretending to discuss every detail, or to enter into the politics on which many of the events necessarily turned. It was fitting, indeed, in the interests of impartiality, that the task should have been entrusted to a German officer who served on the side of the South, if it were only that the important French work which has lately appeared is from the pen of one who not only fought against the South, but confesses himself an ardent partisan of the cause of the Union. We have lately seen that the Count of Paris, in his zeal for this cause and his hatred of slavery, has hardly allowed himself to do justice to the soldiers who took up arms in all good faith for those State rights which they held as having the first claim on their allegiance. Those who study Major Scheibert's volume will find no dissertations either attacking or defending any political action on either side. The very purpose of his work forbids them. A few words only of the preface tell us that throughout the war he devoted himself ardently to the cause of the Confederacy; but he promises his comrades that his study of the contest shall be an impartial one, and he keeps conscientiously to his pledge. Of the six chapters, which are complete essays in themselves, that follow his somewhat too abridged narrative of the war, those on the Artillery, the Navy, and the Sanitary Service are avowedly taken from studies of the Federal arms, as presenting the more complete forms from which to draw the lessons promised. But it is in the closing one, "Reflections and Biographies," that the warmth of his admiration for General Lee, though it does not prevent him doing justice to other commanders, shows that he has been touched by the nobility of that grand character, which seems to have the same charm for those who study it in retrospect that the hero's genial manner and simplicity of heart had for those who surrounded him in the days of his triumphs.

Of this part of the work we shall speak later. For the present we turn rather to one of the essays on those arms the working of which Major Scheibert personally observed during his service with the Confederates, and we select purposely a chance passage on the action of Stuart's cavalry, to show how clearly he explains American peculiarities and their causes. The general description runs thus, being illustrated afterwards by certain particular cases:—

The nature of the country, cut up as it was in so many ways, rendered the action of a large cavalry corps as a tactical whole an impossibility. The largest body formed together for actual tactical purposes under single command was the brigade. Although Stuart actually raised his cavalry corps to a strength of twelve thousand sabres, the brigades worked separately according to some general plan towards the common end, each being limited to itself for real tactics. From this it followed accordingly, that the cavalry could not serve as a decisive arm in battle. And even if the ground in any case permitted the action of larger bodies, the cavalry was too seldom united in such masses to be able to use it. It would have failed in the continuity of attack necessary for the successful action of horse in a battle, the sort of step-by-step support to be given one to another by the different units. Within the brigade the cavalry were usually in two lines, either one behind the other, or the second in support of the wings of the first. Occasionally, as in the affair at Brandy Station, attacks were made in echelon of regiments. For such it was Stuart's desire, as well as that of his staff officer, Von Borcke, that the intervals of the echelons should be left to choice

and circumstances rather than fixed by order. The cavalry kept up a constant effort to gain the enemy's wings, and so there was either a small reserve kept in hand to meet such a flank attack, or it sometimes happened that a troop had to be withdrawn suddenly from the mass sent to attack, and thrown round to meet the threatened movement.

After this account of the Southern horse, two of its chief actions are narrated—that of Brandy Station, in August 1862, and another which soon followed it, in which part of Stuart's command surprised and captured the head-quarter camp of General Pope, who commanded the Federal army. In these Major Scheibert naturally uses largely the Memoirs of his countryman Von Borcke, who was Chief of Staff to Stuart; as also when he goes on to describe the famous raids which that General began, and which were afterwards copied with marked effect by the mounted corps—cavalry it would be wrong to call them—which the Union generals brought into the field more and more as the war went on, concluding it finally by the despatch into Alabama of a separate army under Wilson, which had no infantry with it at all. Of Von Borcke the author speaks in the highest terms, declaring that his sure military eye and determined courage made him Stuart's strong support, and the idol of the whole cavalry, and commending his Memoirs to all cavalry officers as certain to be read with both pleasure and profit. On Stuart he comments even more warmly, and the passage is perhaps the better worth quoting as the writer did not serve under the great soldier he describes, and his eulogy cannot be attributed to subtle personal influence, while it has a general moral that reaches far beyond the history of the army of Northern Virginia:—

One important basis [he says] for the successful handling of the cavalry was the good personal feeling and intimate knowledge of each other among its chief officers. The brigadiers had blind confidence in their commander, so powerful in action, so unwearied in his exertions. The personal qualities of him who leads are never so penetrating and vivifying as among cavalry, with which arm the moments for action shift so rapidly, and plan and execution follow one another so closely. Stuart not only influenced his men by the sense of his personal courage, his coolness, his inexhaustible fertility of resource, and his firmness in executing his purpose; but, framed by nature to be a leader of horse, he won and inspired his troopers by kindling words, eyes of fire, and a humour that no circumstances could overcome.

More interesting perhaps still, in a purely professional point of view, is that part of the closing portion of this essay which explains what made raids at once so exceptional and so formidable in American warfare. To succeed as the earlier adventures of this kind did—for it is admitted that those of 1864-65 had not the same striking effect—they must be used against raw troops, armies dependent on very long lines of supply, in districts where there are few railroads or telegraphs and only bad roads, where there are woods to conceal their movements, and where the cavalry on the other side is unequal to the assaults in spirit. It became very much easier, Major Scheibert adds, in the later stages of the conflict to ward them off, and "on European theatres of war they will not profit much, as may be understood from studying the conditions already described." Nevertheless, he concludes, Stuart's cavalry was animated to them by the same knightly spirit of adventure as that which has recently led the German horse on to the performance of those services which have made it so renowned.

It would have been interesting indeed to have had from this able pen a similar notice of Sheridan and his mounted corps. But Major Scheibert, if thoroughly impartial, is so by omission as well as execution, devoting his cavalry chapter as completely to the Confederates as others before mentioned are to the Federal arms. But we must hurry on to the final one, as possessing more personal interest. As before noticed, it contains reflections, with anecdotes interspersed, as well as some short personal memoirs. Of the anecdotal part we may say that it is so carefully done as really to illustrate the history to which it is attached. There is a capital example given of the independent working of the departments of the Southern army, in the case of a commissary in Longstreet's Corps with the rank of major, who found his accounts getting more and more hopelessly beyond him. He was entirely dependent on his clerk, and had the best practical opportunities of observing that the latter had thoroughly mastered the business in which he himself failed. At last, convinced of what was the right course, he one day took his way straight to Longstreet's tent, and in the interest of the army begged leave to resign his functions, and urged that his more able assistant should be nominated to his post. The General (who, it must be supposed, knew beforehand something of the truth) assented at once; the arrangement was duly carried out; and, at his own request, the ex-major continued to serve on in the same office as a private in which he had hitherto ruled, not without much gain of respect from his comrades for an act of self-abnegation which probably, from what has been long known of the shortcomings in Lee's commissariat, might have been largely followed with much advantage to the Confederates.

The gallery of biographical sketches which closes the volume includes Stuart (on whom Major Scheibert dwells but slightly, having said so much of him in an earlier part), Jackson, Sherman, Grant, and Lee; and it is a striking testimony to the fairness of his judgment that the two distinguished Federal commanders receive full justice, their magnanimity in the hour of victory being specially extolled. We could here again have wished that Sheridan, whose fame at the close of the war stood out so high, had been added to complete the galaxy of brilliant leaders. To have done this just now, when that General is thought to have been severe on the German strategy of 1870-71, would have been a graceful act on the part of one who speaks for the Prussian staff on American subjects. Lee is purposely reserved for the final paragraphs of the volume, as inevitably the true hero of the great epic known

* *Der Bürgerkrieg in den Nordamerikanischen Staaten, militärisch beleuchtet für den deutschen Offizier.* Von J. Scheibert, Major. Berlin: Mittler. 1874.

as the American War. For the more, our author tells us, referring to his former chapter on American strategy, that he sought to arrive at an independent judgment by abstract study of the war, and by the most objective treatment of its events, the more highly shone out the individual glory of General Lee, whom people and army alike honoured with their common phrase, "He is great as a general, but still greater as a man." As the work we are about to part from is essentially a scientific one, we cannot close our notice of it more fitly than by translating the military judgment pronounced on this great commander and his strokes of war. Probably no truer one has been written of any general:—

Not with the sudden yielding to some passing thought, as the cavalry leader who must form his plan on the spur of the moment, but by severe labour, tedious combination, and ceaseless comparison, were his resolves framed. He felt the overwhelming responsibility that lay upon his shoulders. He saw the flower of the people's offspring, the fate of his country, placed in his hand. He was fully sensible of the absolute confidence which staked its all upon him. The deep responsibility he felt to heaven and to the people that so trusted in him caused him to throw his whole power into the purpose of making his plan as complete as possible, freeing it from the doubts of chance, and avoiding the least mishap which might cross his design, and damage it in its entirety. After one of his battles he said to me, "I make my plan as well as my human powers admit, but on the day of battle, I leave the fate of my army in God's hands; my generals have then to do their part."

But, it is added, his goodness of heart was free from all mere sentimentality. Humanity itself in feeling, he was stern against all conscious dereliction of duty. And while every glance at a wounded man gave him a sympathetic pang, he never stayed the energetic pressure necessary to carry out to its end the plan he had once put steadfastly before him. Brought up to richer fare and better expectations than almost any man of the host he led, he was the simplest of all in his surroundings; but when a stranger was entertained, as our author himself was, the honour was felt to be so great that it effectually made amends for the scantiness of the fare.

EGYPT AND ICELAND.*

THE first question suggested by this book to most readers will doubtless be, What is the connexion between Egypt and Iceland? Why should we not join together any other two places, such as Khiva and California, or Timbuctoo and Transylvania? It may be doubted whether even Captain Fluellen could have found any points of analogy between districts so widely remote in every conceivable relation. After our readers have sufficiently racked their brains in guessing at some profound connexion, we can give them a solution of the problem as simple as that of Columbus's egg. The connexion is simply that Mr. Bayard Taylor visited both countries in the same year and had not enough to say about either to make a book of it by itself. Such a mode of composition cannot, as Mr. Taylor would be the first to admit, produce an artistic whole. We gather from the various chapters, though it is not stated on the title-page, that they were originally letters to the *New York Tribune*; and we daresay that the readers of that journal were glad enough to have a letter every now and then from Mr. Bayard Taylor, wherever he might happen to be wandering. It is a virtue in a newspaper to resemble the sheep's head, about which, according to the Scotchman, there is a deal of "fine confused feeding." We like to browse aimlessly up and down the various columns, stumbling at one moment upon a horrible murder, at the next refreshing our minds with a bit of theology, and winding up with a discussion upon sewage. As a rule, however, a book is supposed to form more or less an organic whole; and heterogeneity is rather a failing than a merit. We should be glad to see this rule observed in books of travels, for the simple reason that twice nothing does not make something. Mr. Taylor spent a week in Iceland, and somewhere about a month in Egypt; and though a day or an hour in a strange country may give a reporter a sufficient peg to hang a letter upon, it can hardly justify the production of a less ephemeral form of literature. There are indeed some persons who turn all that they touch to gold; there are men of genius who can confer an enduring value upon the merest trifles, and whose most cursory letters are worth far more than the most elaborate labours of others. Mr. Taylor is an accomplished and excellent writer, but he does not quite reach this standard. The last performance of his which we happen to have read was the translation of *Faust*, and he certainly deserves a very high place amongst the numerous authors who have tried what is perhaps an impossible feat. But if Mr. Taylor had written an essay giving his first impressions of Goethe after a single reading, and tacked to it another containing a similar criticism of Schiller, we don't know that we should have cared to study the result.

We have made these remarks, which are perhaps a little ungrateful, because after all Mr. Taylor has so many merits that we expected something more from him. It is perhaps wrong, though it is certainly natural, to be angry with a man for giving you what turns out to be a penny when you guessed it to be a guinea, even though you had no cause for expecting anything at all. Mr. Taylor has therefore suffered in our minds merely because we were unduly sanguine. We must endeavour to do justice to the good qualities which he displays, in spite of comparative disappointment. He represents, in fact, a class of traveller which we could wish to

be more frequent. It is a moot question whether on the whole the vulgar American or the vulgar English traveller is the more exquisitely disagreeable. Both specimens are to be met with in vast and increasing abundance upon every line of European travel. We find them climbing Mont Blanc and the Pyramids, and treading upon our toes in Paris and St. Petersburg. A long series of careful observations has led us to the conviction that on the whole the Englishman is the more annoying when he sets about it, though perhaps a certain feeling of shame for our country may have unduly heightened our vexation. Both races are equally ignorant, and show an equal indifference to all the beauties of art and nature. But the American, if he is rather more obtrusive, is also rather more simple. The English tourist tries to conceal his ignorance by a sulky affectation of dignity. The American blurs it out with a naïveté which is at times almost touching. He is not in the least ashamed to confess that he never heard of Raffaele before he crossed the Atlantic, or to ask for information as to the most rudimentary bits of traveller's knowledge. Of the two we prefer his transparent ignorance to the awkward and thinly veiled ignorance of the Englishman, but we confess that the ordinary traveller of either breed is an undesirable companion. It is obvious, however, that he is likely to become more abundant. The rapid spread of the English language all over the world proves the increase of the English-speaking traveller. Mr. Taylor, comparing Egypt at the present day with the Egypt of twenty-two years ago, is struck with the extraordinary progress made by the native population in acquiring this most intrusive of all tongues. It is rapidly becoming less and less necessary for an Englishman or an American to acquire any other language than his own. The consequence is that the Cook's Tourist and the kind of American whose humour is represented by Mark Twain are finding themselves more at ease in every part of the world. We could wish that they might learn a little from Mr. Taylor's example, though we are only too much afraid that the process may be the reverse. Mr. Taylor, in fact, though a thoroughly intelligent and cultivated man, finds it necessary to make rather odd concessions to the inferior kind of traveller. He sees the Pyramids, and is affected, as every man of any sensibility must be, by the sight. But, having allowed himself to be carried away into an expression of his feelings, he ends by a sort of apology. He declares more than once that he does not regret the presence of the intrusive modern element which is disturbing the ancient calm of the East. He is bound to profess himself a "progressist," and whether in Egypt or in Iceland sternly guards himself against sentimental yearnings over the past. Mr. Taylor is, in fact, so far in sympathy with his countrymen that he clings to an optimist view of things in spite of the most pressing difficulties. The vulgar American congratulates himself without remorse when an historical monument is knocked out of the way by a railroad; and sees in the substitution of skin-deep civilization for the old types of Oriental culture nothing but an unqualified improvement. Mr. Taylor knows better than to join unreservedly in such glorifications of very doubtful changes; but he is afraid of being found unfaithful to the creed of progress. He tries hard to believe that all is for the best in this best of all possible worlds, and will not see that there can be any conflict, except of a purely transitory nature, between modern democracy and refinement. Doubtless if he had ventured to say in plain terms to the readers of the *New York Tribune* that their countrymen were destroying works of art incomparably superior to any that they can create, the remark would not have been palatable. And yet in Egypt, if anywhere, such a doubt must frequently occur to the most unqualified admirer of modern progress. Mr. Taylor gives an account, and it is perhaps the best part of his book, of the wonderful discoveries made by M. Mariette. We need not ask how far the conclusions reached by this remarkable investigator will be ultimately confirmed by independent critics. But, if we assume with Mr. Taylor that they are unquestionable, they certainly give rise to some curious reflections. According to them, it is satisfactorily proved that the great period of Egyptian art belongs to the age of Cheops; and the first historic king, Menes, who reigned more than four thousand years before Christ, must be regarded as himself the product of a long stage of unrecorded development. Among the various relics preserved in M. Mariette's museum is a statue recently discovered, which is supposed to be about six thousand years old. It is carved in sycamore wood, which has now become "hard and resonant as metal." The face is described as "remarkably intelligent, cheerful, benevolent—a Shakespearian head, one might say, it gives such evidence of a large, rich, and attractive nature." The eyes are formed with curious ingenuity. "The lashes are thin rims of bronze; the whites are formed of white opaque quartz, the iris of rock crystal, and in the centre of each is set a small crystal with many points, which from every side reflect a keen point of light like that in the human eye." When one reflects upon all that is implied in such a statement, on the periods of time which must have been necessary before such an art could be evolved, one becomes almost dizzy with the long perspective of prehistorical evolution thus dimly revealed. Nor is it altogether satisfactory to reflect upon the history of later progress. Such art is doubtless rude in many senses; and yet the difference between such a statue and one which could be ordered (say) in New York at the present day is not altogether in favour of the modern artist. The natural suggestion is that what we call progress is in fact a very mixed and qualified affair; that long periods of decay have alternated with periods of growth; and that even definite improvements have

* *Egypt and Iceland in the year 1874.* By Bayard Taylor. London: Sampson Low & Co. 1875.

coincided with the stamping out of ancient forms of civilization, often superior in many points to those which succeeded them. Nothing at any rate could be more calculated to make one pause before joining unreservedly in the modern chorus of exultation over every change which sweeps over the face of the earth. Improvement seems to be inextricably bound up with destruction, and if, on the whole, there is a gain, it is a gain on the balance of many conflicting results, not of a uniform and undiluted character.

Perhaps, however, we are drifting far from Mr. Taylor. We only mean to say that we feel it a little difficult to share his complacency when we see a Mark Twain making jokes in face of the Pyramids. However, Mr. Taylor is evidently a benevolent as well as an accomplished man. He seems to make friends with Egyptians and Icelanders with equal facility; he talks Arabic and Danish as the case may require, and finds everywhere something to admire; he writes a poem under pressure to express the enthusiasm with which the Americans regard the descendants of the old discoverers of Vinland; and the verses not only show a kindly feeling, but are really a very fair performance of their kind. Nor should we omit to reckon amongst his merits that he is very candid as to his own weaknesses, and admits with great frankness that he is a human being liable to fatigue, and capable of being pitched over the head of a refractory pony. We must therefore part with him in kindness; though we are still rather at a loss to find a sufficient justification for putting together in a permanent form letters which might well have been left to repose in the files of the *New York Tribune*.

SCENES OF RUSSIAN LIFE.*

AMONG the many vexed questions of the present age, we are told by the author of the *Neglected Question*, that of "woman's right to dispose freely of herself" occupies a prominent place, and finds numerous advocates. But too many of the supporters of that right, we are further informed, carried away by a generous desire to save a human soul from the tyranny of what they term "narrow morality," overlook another human soul which has an equal right to protection, forgetting the child of the woman who, according to their doctrine, has a perfect right to change one affection for another. As an illustration of these statements, it seems, Mr. Markowitch composed the story of which there now lies before us an English version, rendered doubly remarkable by having been translated by Princesses and published next year.

Vera Loubiansky is "the very prettiest young lady" the narrator of the story has ever beheld, although she is the mother of a lad of fourteen; and her "delicately-arched eyebrows, her finely-cut little nose, her pouting mouth with its glistening teeth," and her other innumerable attractions, fascinate older observers as readily as this youthful admirer. More especially, or at least conspicuously, fascinated is "a young and exceedingly handsome Hussar officer," with a long silky moustache, sharp regular features, and fine dark eyes. This good-looking scapegrace, Baron Felsen by name, who has but lately returned from the Caucasus, whither his bad conduct had sent him as a private soldier, makes impetuous love to the beautiful Vera, who is greatly flattered by his marked attentions. Over her, however, are two watchers set. The one is her young son, who hates the Baron with a bitter hatred; the other is her middle-aged husband, who follows her with his eyes so long as she remains within the scope of his vision. More he cannot do, being the victim of an almost complete paralysis. He is "a tall man, of about forty-five years of age, with an almost transparent, wan-looking face." So crushed is he by the terrible stroke which has fallen upon him that he offers scarcely any indications of life beyond the movements of his eyes. Sometimes, it is true, his trembling fingers attempt to grasp some object, or his pale lips succeed in producing a low confused murmur which only love can interpret. But his eyes alone obey his will. "As the inscription on a tombstone relates its history, so the whole life, which has almost left his poor body, was concentrated in those wonderful eyes; they burnt with a restless, eager fire in the deeply sunken sockets, and expressed a series of sad, powerful thoughts."

With these sepulchral eyes the poor paralytic watches his beautiful wife, as she flutters, butterflylike, through the flowery world of pleasure from which he is excluded. Unfortunately she is not grateful for his attentions, having been greatly annoyed by his behaviour during the earlier years of their married life, when he would oscillate between fits of jealousy in which "he would dash about the room like a maniac," and of affection in which "he would throw himself on his knees and entreat her to tell him what he should do to gain her love." Under the influence of fresh Ukraine air the invalid gradually improves in health, but at the same time his fascinating wife becomes more and more subjugated by the influence of the handsome Baron Felsen, who is capable, when the occasion warrants it, of pronouncing discourses on love, philosophy, and all other subjects, three pages long without a break. At last comes the catastrophe which has long loomed in the distance. One moonlight night the crippled husband insists upon being taken out in his invalid chair, and wheeled up to the

garden-house in which are his wife's private apartments, on the windows of which he was in the habit of gazing for hours in the hope of catching a passing glimpse of her he loved. But on this occasion, at the dead of night, he first stares at it with "something awful in the expression of his haggard, painfully emaciated profile, with the large eyes glaring into the garden," and then seeks it with "such a glance of despair and impotent wrath" flashing from under his half-closed eyelids as makes the narrator feel cold all over. The garden-house is reached; the shutters, which can be opened from without, fly apart with a bang, and a flow of light streams out from within, clearly defining the distorted features of the unfortunate husband as he looks into the room in which his wife reclines on a sofa "with her head slightly thrown back and her hands clasped in desperation," while beside the closed door stands Baron Felsen, holding the handle with one hand, and in the other "something long and bright, like a dagger." A "wild, heart-breaking cry" is heard, and the husband, "by a supreme effort, raised himself to his full height, with a menacingly extended hand . . . and fell the next moment a huddled mass on the damp grass." This is a sufficiently unpleasant scene, but still more disagreeable is another in which young Vassia Loubiansky accuses his mother of being his father's "murderess." "You rave, you are delirious," she said. "So your lover has just said also," retorted Vassia, with a bitter laugh, &c. &c.

We must say that, so far as the reputation of Russian society is concerned, this book had better have been left untranslated, for it by no means conveys a favourable impression of Russian social life. Among other points this one is worthy of observation, that listening and watching at doors and windows seem to be reckoned among the usual means of gaining information. At p. 124 of vol. i. the narrator overhears a long conversation which was not intended to reach his ears; at p. 211 the prude of the story, Mlle. Galetchka, gently opens a window, and thereby contrives to listen to another piece of forbidden gossip; at p. 248 the narrator is again found surreptitiously listening at a window; and at p. 282 he a third time, but in this instance unintentionally, becomes the unsuspected auditor of confidential communications. In this respect, as well as in many others, nothing can be more unlike the typical English schoolboy than the young heroes of the Russian story, who do not greatly commend themselves to our admiration, although they are capable of talking in the most poetic style about clouds and destiny, and of quoting and criticizing German poetry. Heroes of romance who die young are apt to be offensive, but there is something unusually priggish and irritating about the juvenile Russian who remarks on his deathbed that it is happiness for him to die, for he "should never have been a good man." It may be true that "when a child has witnessed the grief of his father at the heartlessness of his mother, it awakens within him a bitter feeling of shame and inward rage which no wise sayings, no well-sounding phrases, can destroy or root out"; but we could well dispense with that child's acquaintance. On the whole it seems a pity that the Princesses Ouroussoff did not turn their attention and their remarkable power of translating from their own into our language towards a better specimen of Russian literature. The only feature of the book they have selected on which unmixed praise can justly be conferred is its delineation of Russian scenery and country life.

A somewhat similar criticism to that conveyed by the last few lines may be passed by unsentimental readers upon the second of the novels before us. In *Darkness and Dawn* we are presented with a Russian tale which may be read with interest as a study of manners and landscapes, but which can scarcely claim to stand high as a work of fiction, though its later scenes are not devoid of a certain melodramatic power. From its pages, as well as from those of the *Neglected Question*, a fair idea may be obtained of a country house and its surroundings in South Russia. We see "the long, low building, with innumerable windows, and a roof of brightest green," the slender pillars supporting its verandah covered with jasmine and roses. Behind stands a forest of pines; in front the ground slopes away towards the bank of a rapid stream. At a little distance appears a rustic village, above which rises the green dome of the white-walled church. At times we drive along the road which winds like a white ribbon between the cornfields, watching by day the lustrous wave of gold which undulates along the surface of the gracefully bending rye, or at night gazing far away over the level expanse, which resembles a tranquil sea sleeping beneath the mellow moon or the softly gleaming stars. Many an idyllic scene we witness also; as when, for instance, the villagers in the *Neglected Question* crowd around the kindly lady of the manor on her name-day, the men and women kissing the hem of her dress, and the children offering "nosegays of wild flowers, and little earthen pots full of wood strawberries." Not that all is idyllic in *Darkness and Dawn*, for its hero is a serf, and its end and aim is to point out, and to illustrate by his troubles, the moral darkness of the days in which the institution of slavery existed, compared with the brightness of the new day which sprang into life together with the Emancipation of 1861. Nothing can be better than Miss (or Mrs.) Annie Grant's intentions, and there can be little doubt about the merits of the cause which she has undertaken to support.

The hero of her story is a young Russian upon whom nature has conferred every boon but that of freedom. A serf belonging to a rich and careless master, he has received an education which has developed and matured his great natural talents. In appearance and in manners he is all that the most romantic

* *The Neglected Question*. By B. Markowitch. Translated from the Russian by the Princesses Ouroussoff. 2 vols. London: Henry S. King & Co. 1875.

Darkness and Dawn: a Russian Tale. By Annie Grant. 2 vols. London: Hurst & Blackett. 1874.

maiden could desire to find realized in the form of a lover; and as he is long successful in concealing the terrible fact that he is a slave, he naturally produces the most favourable impression upon the minds of all the young ladies with whom he makes acquaintance. More especially does he win the heart of the enthusiastic heroine of the tale, after he has saved her life by means of an unusual expedient. As he and she are strolling one sultry evening through the meadows, there suddenly arises a terrible hurricane. With the greatest difficulty he manages to guide her safely through the storm until the river is reached which separates them from security. But when at length they arrive at the spot where a bridge should be, they find that it has been swept away by the swollen and raging waters. Fortunately the abyss is not more than eight feet wide, and there is still left a remnant of woodwork which considerably lessens that space. So he throws his tall body across the river, thereby forming a temporary bridge, face downwards, placing his feet on one side and holding by his hands on the other. And she, "not even expressing the slightest astonishment at his singular and dangerous plan," springs lightly over him and reaches in safety the opposite bank. No wonder that after, "with a superhuman effort, he swung himself over the chasm," she promises to marry him, and fulfils her promise without investigating his social position. All goes well for a time, and "the loveliest woman in St. Petersburg," for such she is universally acknowledged to be, enjoys her life in the capital as the wife of the millionaire whom she does not yet know to be a serf. Unluckily his master, the wicked Prince Usoff, makes his appearance, admires his slave's wife (who indeed has herself become his slave), and in order to bring her under his power, begins to put pressure upon his property, her lord. That unfortunate being, conscious that he is "a living disgrace to himself, a blot upon society, a nonentity in the world," shows symptoms of being on the point of losing those wits to which his excellent education has done such justice. In order to preserve them until the impending Third of March will secure them by the gift of freedom, his wife dissembles, and keeps the princely profligate from dangerous action by lapping his senses in the slumber of a fool's paradise. At last the Prince discovers that he has been tricked, and hastens to revenge himself. But before he can strike a blow the booming of cannon and the ringing of bells proclaim that serfdom has passed away for ever, and the emancipated hero and heroine, who have been for a time separated by circumstances, are "re-united once more in the bonds of love and sympathy."

HORE'S ANCIENT TERMS AND MEASURES OF LAND.*

THIS thin book kindles in us a strong desire to know something more of "Pole Hore, co. Wexford." In times past there was a Mr. E. H. Barker, author of many works, who used to put after his name the initials O.T.N. These caused much puzzle in many minds, as no one knew of any degree or learned society or order of knighthood which could be expressed by the letters O.T.N. It turned out that the mysterious formula merely set forth in a dark way the whereabouts of Mr. Barker's dwelling-place; O.T.N. stood for "of Thetford, Norfolk." Now, had Mr. Hore described himself as O.P.H.C.W., the mystery would have been greater than the mystery of O.T.N. in the proportion of five to three. Mr. Hore however despises mystery, and gives us his dwelling-place at full length. But then his dwelling-place is by no means so intelligible as Mr. Barker's dwelling-place proved to be when it was once set free from the veil of initials. Of Thetford, Norfolk, once an episcopal city, still or lately a Parliamentary borough, and the scene of more than one historical event, most people must have heard, even if they had not heard of Mr. E. H. Barker. To say that a man lives at Thetford does in a manner enlarge our knowledge of him. To say that he lives at "Pole Hore, co. Wexford," leaves us much more in the dark. Most minds will get no further than the idea that Mr. Hore lives somewhere in Ireland; the most adventurous will only be kindled by the name of Wexford to ask whether he has anything to do either with the Ostmen or with Oliver Cromwell. Still the book makes us wish to know more of Pole Hore. It must be a singular place where it is plain that there is a large library diligently used, but which seems to contain only one book of the present century. Mr. Hore has evidently worked hard to improve his own mind, and he is benevolently anxious to improve the minds of others. But he seems to have heard not a word of all that others bent on the same objects have been doing for the last fifty or sixty years. There is clearly a spirit of inquiry at work at Pole Hore, but its inquiries have not reached the modern world. Mr. Hore is at work on subjects which have occupied some of the greatest scholars of England and Germany for at least two generations, but of none of their writings does he seem ever to have heard. It would be in vain to ask whether Mr. Hore has crossed the German Ocean to learn the names of the Maurers and others their fellow-workers; St. George's Channel seems to be barrier enough to keep the works of Allen, Kemble, and Stubbs from ever finding their way to Pole Hore. The last cargo of books which got there would seem to have consisted of Kelham and Blackstone. Mr. Hore says, with great truth, that "the divisions, tenure, and value of land, with the state of society at the time of the Domesday Survey, are matters of legitimate

historical interest;" and he adds, what we are glad to hear, "they have been of great interest to myself." But Mr. Hore's labours in this interesting study seem to have been a case of the pursuit of knowledge under difficulties. The library at Pole Hore is, by his account of it, made up chiefly of books most of which are "printed in quarto, some in black letter, and interlarded with many Latin quotations, and contain a great deal of extraneous information." They are "ancient glossaries and law dictionaries," the only books that Mr. Hore seems to know of in which a man can find anything about the Hide or about Bookland. Mr. Hore's dislike to black letter perhaps shuts out a good many German books. Schmidt's *Gesetze der Angelsachsen* is unluckily in black letter, and, though not printed in quarto, it is printed in tall octavo. But most German books are in octavo, and the fashion of printing them in Roman letters is largely spreading. So a day may come when the labours of our Continental brethren may be made available at Pole Hore. Still there are books written in plain English from which Mr. Hore may learn something. Palgrave's *English Commonwealth* is certainly printed in quarto, but it may plead in extenuation that it is not in black letter. Allen and Kemble labour under neither disqualification; they are not only in Roman letters, but of common octavo size; and Mr. Stubbs's *Constitutional History* is of a size smaller still. Perhaps the difficulty lies, after all, in the Latin quotations and the "extraneous information." What is "extraneous information" and what is not may sometimes be a matter of opinion between Mr. Hore and the writers of whom he complains. But the Latin quotations certainly are a serious point. It is very hard indeed for a man who writes about Domesday, or about any of the other matters which Mr. Hore takes in hand, to do without some Latin quotations. It is equally hard whether he wrote two or three centuries back in a black-letter quarto, or whether he writes now in a Roman octavo. Mr. Hore himself, who is in thin octavo and Roman letters, cannot wholly get rid of Latin quotations. As for "extraneous information," perhaps the description of Mr. Hore as "of Pole Hore, co. Wexford," may pass as a specimen of it.

However this may be, facts are facts and difficulties are difficulties. The Pole Hore library suffers under quartos, black letter, Latin quotations, and extraneous information. Some remedy is needed; something different is needed by Mr. Hore himself, and he thinks very naturally that something different may be needed by others:—

It occurred to me that a treatise embodying in alphabetical order a short account of our ancient tenures and measures of land, presented in a readable type and somewhat clearer form than is to be found in our ancient glossaries and law dictionaries, would be a useful addition to the library of the antiquarian or legal man of business.

Things being in this case, the old books not suiting, and the new books not being known at Pole Hore, Mr. Hore gallantly undertook to supply the need himself, after the pattern of the man who said "Whenever I want a book, I make it." And the curious result is the publication of a book in 1874 which reads as if it had been published in 1774. Not one ray of modern research has made its way to Pole Hore. Folkland and Bookland, for instance, are expounded as it was quite pardonable to expound them in the days before Allen, but as it sounds odd to hear them expounded now that the nature of *ager publicus* in all parts of the world has been set forth a hundred times. "Charter-land," according to Mr. Hore, "is a law term, and is land held by charter or written evidence, otherwise freehold. The Saxons," he adds, "called it Book-land or Book-land, and it was by that name distinguished from Folk-land, which was copyhold." "Allod" is "an ancient Saxon term," and yet it is somehow "supposed to have been derived from the Celtic 'allod,' i.e. ancient." Then comes something about "barbarous borders," a reference to Montesquieu, and—we should hardly have thought that so modern a part of the world would have been heard of at Pole Hore—a statement that "land in the United States is mostly allodial." Then we have an article of "Fee, Feud, Feodum, or Fief," and an extract from Blackstone, which reads funny enough to a student of Waitz. It gives one a strange feeling to read in 1874:—

It may be sufficient to state, in a treatise of this nature, that most historians agree that the ancient feudal tenures of land originated in the system of military policy and protection adopted by the warlike tribes of the north, who spread themselves over Europe at the decline of the Roman empire.

Then we get a dissertation on the Hide, as the Hide looks to one who knows not Kemble, and one on Gavelkind, on which some light might, in other places besides Pole Hore, have been got from Mr. Elton's *Tenures of Kent*. Ingulf is of course quoted with all solemnity. It is only within two or three pages of the end that we light on a passage which shows that Mr. Hore is aware of the existence of one writer in, if not exactly of, the nineteenth century, and even he is described as he could not have been accurately called for fifty or sixty years past. This is "Mr. H. Ellis, the late librarian of the British Museum." Sir Henry Ellis, as he is called by the world in general, was useful in his day, though we have always held that, according to his light, his forerunner Kelham, whose books are not to be despised even now, stood far above him. But without searching—and Mr. Hore gives us no reference to help us in our search—we cannot believe that it was from Sir Henry that Mr. Hore borrowed his definition of "Villani"—"from the French *villain*—vile—a man of servile or base degree." On our side of St. George's Channel, it is not usual to derive Latin from French; and does Mr. Hore, or does he not, think that *villanus* and *vile* have anything to do with one another?

The oddest thing in turning over the book is to see the most

* An Explanation of Ancient Terms and Measures of Land, with some account of old Tenures. Collected and compiled from various sources, and arranged in alphabetical order. By Philip H. Hore, of Pole Hore, co. Wexford. London: Basil Montagu Pickering. 1874.

memorable passages in Domesday, passages which have been found capable of awakening historical and even romantic interest of the highest order, quoted, as they might have been by Blackstone himself, without a notion of their meaning, seemingly without any notion who the people mentioned in them were. We have long extracts from Sir Walter Raleigh about "Earl Gurdus" and "Turkillus," and Mr. Hore quotes the spurious charter to the person whom he calls "Allan, Earl of Britain," with its reference to an imaginary siege of York and an imaginary forfeiture of Earl Eadwine. And the very last sentence in the book contains the entry of the grant made by the Sheriff Godrie to his daughter's teacher in the art of embroidery, quoted, it would seem, without a glimmering of its importance as to the tenure of land and the history of art, to say nothing of its touching personal interest. And we regret that Mr. Hore, in expounding the nature of tenures, has not condescended to explain the exact position of the gentleman to whom his book is "dedicated by permission," and who appears as "S. Little, Esq., of the county of Wexford." A man who is "of" the whole county of Wexford must surely be greater than a man who is only "of" Polo Hore, or any other place in that county. Can we be right in the guess that Mr. Hore is the man of Mr. Little, holding of him doubtless by the most honourable tenure over devised by any of the barbarous hordes who overran the Roman Empire in the days of its decline?

The spectacle of such a book as this, put together by a man who is plainly a single-minded searcher after truth, is a very strange one. What can be the state of mind of a man who takes an interest, one might say an intelligent interest, in a certain subject, and yet who never stops to think—who takes on himself to write books without stopping to think—whether anything has been added to the knowledge of that subject since the days of his great-grandfather? Does Mr. Hore never look at an advertisement or a bookseller's catalogue? Is there no one in the county of Wexford, no fellow-*gerith* of Mr. S. Little, who reads or hears of books written by people born since the revolt of the American colonies? We take this date, as we have a vague notion that Sir Henry Ellis must have been born before. But Mr. Hore is so evidently ingenuous that we feel sure that the day of enlightenment will come, that he will sooner or later wake up, like the Seven Sleepers of Ephesus, to the existence of the nineteenth century, its scholars, and their researches. It will be a white day at Polo Hore when the cargo of modern books comes at last, and when the writings of the inquirers of modern days, from Palgrave to Stubbs, shall take their places on the shelves of Mr. Hore's library along with the "ancient glossaries and law-dictionaries," whose black letter type and whose quarto size Mr. Hore so feelingly deploras.

IN HONOUR BOUND.*

STORIES founded on the unreasonable sensibilities and imbecile willfulness of women are always interesting in a certain way, though they are also always sad, and generally irritating. Plain common-sense people wonder what there is for the foolish creature to make so much fuss about, and why she cannot be easy and take life quietly like the rest. Why see lions in the way when there are not even hares or rabbits nibbling the sides of the path? Why persist in being unhappy when every one wishes her to be glad, and all try to make her content? The reader gets fretted at the heroine's silly sorrows, and cannot find any sympathy for one who will tilt with windmills and make mountains out of molehills.

It was with something of this feeling that we went through the story of Mr. Gibbon's *In Honour Bound*. Why should it be as miserable as it is? and would it not have been possible to rescue Teenie before it was too late by the safety-lines of reason and self-control? We think Mr. Gibbon cruel in making this bright irrational creature the sacrifice for her husband and Grace Wishart. We would rather have seen her reduced to reasonableness while yet there was time, with Grace bearing to her life's end her cross of love unfulfilled, as many another woman has borne it before her, and been all the nobler and sweeter for her sorrow. There was no valid reason why Teenie should cast herself away as she does on the rocks of passion and false sentiment. She was not one of those tragic creatures doomed from the beginning and by the very nature of things to failure and despair. On the contrary, we have seldom met with a more entirely joyous and delightful girl than this "tall sinewy lass, with wavy fair hair, and plenty of it; big blue eyes; soft rounded features, sunbrowned and healthful," who meets us at her cottage door as fresh as a spring day, as strong as the ocean breeze blowing in her face. She is so charming and natural in the earlier pages that we honestly grieve when she becomes the sickly-minded sentimentalist of the later chapters; the self-torturer, seeing nothing clearly as it is, but only through the blinding mists of her petulant imagination and irrational fancies, and destroying her own happiness, and the happiness of all with whom she is connected, for the sake of foolish feelings by which she is very nearly reduced to the level of moral idiocy.

The opening chapters of *In Honour Bound* are exceedingly pretty. The portrait of this bright heroine, Teenie or Christina Thorston, Skipper Dan's daughter, and a kind of aristocrat among the fisher-folk, frank, innocent, brave, superstitious, loving, rustic,

is purely charming; and the scene where she "tries the spell" with Allie or Alison Burges is full of humour and careful drawing. But we soon have indications, even in those early pages, of the future uncomfortable development, which however seems to us always strained and inharmonious with the leading traits of Teenie's character; and we cannot but think that Mr. Gibbon has somehow wandered from his original model, and found his story stronger than his psychology. In the earlier phases of Teenie, now as a bit lassie fishing in her father's boat with young Wattie Burnett, Dalmahoy's son, crying contemptuously, "Hoot, you fool!" when he loses his bite, and approvingly, "Man! but that's fine!" when he lands his fish; now as the frankly loving maiden trying spells with kindly Allie, indignant when the Oraculum forbids, overjoyed when it promises "love until death"; and, finally, as the pretty nymph down in the cove with her lover, listening to his love-story and yielding to his insistence without much trouble—in none of these pictures do we see a forecast of the future unreasonableness whereby everything goes to shipwreck together. To be sure, there are elsewhere certain scattered indications which, read by the light of the end, come out in more distinctness than when we first meet with them. For instance, when Teenie, after her love-scene with Walter, speaks to the men who gather round her father's boat with a familiarity that annoys him, "laughing at their jokes and apparently taking the liveliest interest in all their movements," there is "an element of defiance in her activity" which tells something of the temper to come. When she is in the boat with her father, on the eve of her marriage, and she asks him if he is "sorry about the morn," and will he miss her when she is "away from the Norlan?" and on his answering her hoarsely, "Bairn, it's like rugging the heart out of me to let you go," she impudently breaks out with "Then I'll not go!" Again, when she goes to Dalmahoy and the old Laird tells her that his son must endure loss and misery if he marries her, she jumps up and, but for Walter's tenderness, would have renounced him then and there, "cold, frowning, scornful," more for wounded pride than for self-sacrificing love. But with all these forecasts, the full development of her character, suspicious, unreasonable, untractable, comes with a certain sense of strangeness and unnaturalness which does undoubtedly mar the reader's pleasure in what is for the most part careful and well-considered work.

Mr. Gibbon has manifest pleasure in his work. All that part of the book where he deals with the simple fisher-folk and their perils is written *con amore*, and with as much knowledge as love. We smell the salt breezes and see the rugged honest men and women, so ignorant and brave, with their dread of novelties and their childish belief in themselves and their old-world spells. One or two anecdotes have evidently been taken from the life. One is that when, during a storm that lasted many days, the women marched up to the manse, where the minister had hung out a barometer, to beseech him to "set the weather-guide to 'fair,'" and he tried to explain the true nature and functions of the instrument, the poor wives and mothers whose husbands and sons were out on the raging sea, though they listened to what he had to say, believed nothing of what they heard. They believed in Skipper Dan's weather wisdom, but not in this strange-looking machine which might be a wizard's work for anything they could tell. So they took stones and smashed it; and when the weather changed soon after this, "Tibbie Gow, who had been a ring-leader in the outrage on the barometer, exclaimed triumphantly, 'I tell't you how it would be!—it's just thae new-fangled whigmalceries that's setting a' things wrang. We maun take care o' the minister, for he's a guid sort o' sowl, though he's weak, like a' man bodies.'" So too we read "taken from life," when the railway was planned and made, and one Willie Stark, "a man in years but a child in mind," burst into his mother's cottage, "crying in much wonder, 'Eh, mither, mither! what do you think I saw but the smiddy running awa with a row of houses!'" The epitaph on Susan Gray with her "two bad legs and a very bad cough," and the further information that "it was the two bad legs that carried her off," is luckeyed enough; but Jean Watt's conversation with her cronie on Sandy's rheumatism is original. "Sandy's just that bad," she says, "he canna move hand or foot; but he's had mustard and vinegar on at the foot o' the shoulder-blades and a batter as big as your twa hands, an' I canna tell you how many salts he's taken, so I'm thinking he'll be some better the morn. What are you paying for tatties now?" Wearied as we are with conventional work wherein not a line is taken direct from nature, but all from fancy models which were never true, disgusted with portraits of men and women evolved out of the depths of the author's inner consciousness, but like nothing to be met with on the face of the earth, bits of pure homely life like these, transcribed direct and absolutely real, come with a strangely refreshing influence. They reconcile us to the "quaint trade" which else sometimes seems to us the saddest waste of time and energy possible to sane humanity, so sad that we wonder how it prospers at all and does not break up by its own inherent worthlessness.

If the complex nature of Teenie seems to us a little beyond Mr. Gibbon's grasp, other characters, simpler and less involved, are very well portrayed. Certainly the best are the simplest, and the simplest are the fisher-folk. Dan Thorston is a good specimen, and rugged kindly Allie is also excellently drawn. The Laird, pompous, artificial, theatrical, untrue, but with a kind heart at bottom, is somewhat hazy, and we refuse to join hands with Dame Wishart, who is too much after the pattern of an old lay figure draped as part sibyl, part hag, to be pleasant. Grace is very

* *In Honour Bound*. By Charles Gibbon, Author of "Robin Gray," "For Lack of Gold," &c. 3 vols. London: Richard Bentley & Son. 1874.

sweet and noble, but we cannot overcome a feeling of incongruity in her intense attachment for Walter. As he was younger in years and lighter in temperament than she, it seems to us that her affection should have been that of a mother or an elder sister rather than a wife to have been in absolute accord with her character; and we do not like the moony mournfulness that possesses her after the boy's marriage with Teenie. To be sure, Walter has no rivals in the place where he lives, and we all know what opportunity and propinquity do for young men and maidens; still, the lines of her nature, as Mr. Gibbon has laid them, are too broad and noble for anything like the mean considerations that would influence lower souls; and we think we have a right to be a little disappointed in Grace, good and true as she substantially is. She is simply not quite good and true enough for her best self, and her self-control might have been more complete. We object to the whole of the episode of Teenie's ridiculous flight. It is silly and unnatural, the act of a maniac rather than of a sane person, inasmuch as there was no existing cause sufficiently strong to excuse such a monstrous bit of wickedness; for even the young wife's excited feelings, consequent on what she hears and sees, are scarcely powerful enough to explain her subsequent flight. And, having run away, she should not have come back again. There is a want of grip and purpose in making what the fisher-folk would have called a stour over a rootless bit of business like this flight and return. If Teenie had to die for the exigencies of the story, and to give Grace Wishart a chance, she might have been killed by a more homely and more probable cause than that of fever from exposure and infection combined. It was a pity to kill her all the same; and we wish she had lived to make a more rational wife in the future for Walter, a good housekeeper, and a pleasant mother for Baby, instead of losing her life for a folly and a fancy not far removed from self-murder.

But though we find faults in this book, we also acknowledge its merits. It is pleasantly written, and many episodes in it are tenderly and quaintly touched. If, as we think, it lacks a certain "staying power," a certain harmony and continuity of interest, it does not lack isolated traits of interest, nor passages of thought and beauty. Mr. Gibbon's forte lies in the faithful delineation of the homely Scottish folk he has seen and known personally, rather than in the more creative and imaginative qualities of a novelist; and the less complex his characters the more lifelike and natural they are. Some authors excel in the portrayal of involved and many-sided natures; he is not one of them. His best work is the homeliest, and the simpler he is the more pathetic and the more interesting are both his story and his style, his characters and his scenes.

CHRISTMAS BOOKS.

II.

PLANTS; their Natural Growth and Ornamental Treatment, by F. Edward Hulme, F.L.S., F.S.A., &c. (Marcus Ward).—"Ornamentists," says Mr. Hulme in the introduction to this handsome volume, "commonly overlook the treasures that Nature scatters around them." Ornamentists—till we read this page, we had not so much as heard that there were Ornamentists—will no longer have any excuse for their negligence, so admirably has Mr. Hulme executed his task. In the three hundred and fifty carefully executed illustrations which adorn his work he shows both the natural form of each plant—we may almost say of each part of the plant—and also the mode in which it has been treated artistically. His examples he often seeks in the carvings that adorn the walls and columns of our cathedrals. As the pictures of the flowers are all coloured, the designer, as well as the carver in stone, will find here much that will be valuable to him. The full descriptions that are given of each plate are for the most part well done. Mr. Hulme, however, is not very strong in the derivation of words. He uses the word "plicate," for instance, and derives it from the Latin "plica," a fold. In another passage he writes:—"The generic name *Crocus* was bestowed upon these plants by Linnæus. Its significance seems not quite clear, as by one writer it is derived from the Greek word for filament or thread; another finds in mythical story an explanation of the name in the ardent passion of *Crocus* for the fair *Smilax*; while a third derives it from *Coriscus*, a mountain of Cilicia."

Scarcely less interesting, though it is written for the botanist alone, and not for the "ornamentist," is the second series of *Alpine Plants*, edited by David Wooster, F.R.H.S., Assistant-Secretary to the Royal Commission on Scientific Instruction and the Advancement of Science. (Bell and Sons).—This handsome volume contains "figures and descriptions of some of the most striking and beautiful of the Alpine flowers." The figures are well drawn and well coloured, while the descriptions are short and to the point. Our only fear is lest so beautiful a work should tempt some lady already too fond of flowers to the edge of a precipice. There have been falls enough already in the search after rare plants.

The Life and Epistles of St. Paul, by Thomas Lewin, M.A., F.S.A. 2 vols. (Bell and Sons).—It is of course impossible for us in a notice of Christmas books to enter into the merits of Mr. Lewin's work on St. Paul and his writings. It has, as the author tells us in his preface, engaged his attention, more or less, for upwards of forty years. "It was," he says, "a labour of love, but proceeded slowly." The present publication is not merely a reprint of the first edition; it is a reprint to which the leisure hours

of the last twenty-three years have in a great measure been devoted. If, as we are told, the first edition was almost destitute of illustrations, the same certainly cannot be said of the two handsome volumes before us, with their 370 engravings. Mr. Lewin has gone to a great variety of sources in his search of illustrative matter, and he has, as he tells us, met "with the utmost liberality, both from publishers and authors." We have views of almost every place that is in any way associated with St. Paul, while antique gems also have been laid under contribution to furnish likenesses. We have the head of "Menander, the comic poet, cited by St. Paul," while even *Lais* appears in the views of Corinth. She might wonder how she gets into the Life of St. Paul with as much reason as did the fly at finding itself in the amber. Together with the illustrations are given many excellent maps and plans. In fact, Mr. Lewin has evidently spared neither labour nor expense to render his work generally attractive.

Military and Religious Life in the Middle Ages and at the Period of the Renaissance, by Paul Lacroix, Curator of the Imperial Library of the Arsenal, Paris. (Chapman and Hall).—This handsome volume is illustrated by fourteen chromo-lithographic prints and upwards of four hundred engravings on wood. "It forms," to quote the author, "a collection of archaeological treasures got together after the most laborious research." The engravings are indeed of great variety and great interest, and throw considerable light on the period of history which they are meant to illustrate. We cannot, unfortunately, speak so highly of the narrative. It is not, we conceive, of any great merit in the original. In its so-called English form it is very poor. We are not surprised to find, considering that the author is a Frenchman, that he finds it necessary to explain how it was that on distant expeditions Charlemagne's army "was rather a German than a French one." He, or his translator, goes, however, rather too far when he states, as he clearly does, that the Iberians invaded Spain, and "the Celts installed themselves among the Gauls" (*sic*), after "the art of war had attained its highest degree of perfection among the Romans." It was not, moreover, in the twelfth century that Tertullian enunciated his ideas in his *Apologeticum*, nor was it Columbus who discovered the new Continent, nor American Vespazius (*sic*) who named it. In the chapter that is given to the Inquisition it will be interesting to Protestants, and instructive also, to learn that it was the Catholics who were persecuted and put to the torment. By the Inquisition, we read also, "the political aim of the Kings of Spain was attained, for the maintenance of religious unity preserved the kingdom from the bloody catastrophes which at that period spread desolation throughout France and England."

Bluebeard's Keys, and other Stories, by Miss Thackeray, Author of "Five Old Friends," &c. (Smith, Elder, and Co.).—For those who would value a Christmas gift, not by the money that was given for it, but by the pleasure that it gives, we could scarcely wish a more charming present than this book of Miss Thackeray's. It contains four stories of modern life, which have nevertheless a most quaint likeness to the Old Fairy Tales whose names they bear. All the stories are admirable in their way; the best, perhaps, is "Riquet à la houppe," with its incidents of foreign travel and its peeps into life among the Alps. "The writers of the fairy-tale hexameters," in which the argument of each story is given, must not miss the praise which is due to them.

Old and New London: a Narrative of its History, its People, and its Places, by Walter Thornbury. Illustrated with numerous engravings from the most authentic sources. Vol. II. (Cassell, Petter, and Galpin).—Many of the illustrations contained in this large volume are curious and interesting; some of them, indeed, are reprints of engravings which have become very scarce. The accompanying narrative is also interesting, though we could have wished that in his account of Newgate the author had, if we may say so, hung less fondly on the gallows.

The Troublesome World; or, Bet of Stone. A True Story, by Lady Barker. (Hatchards).—This is a very curious story that Lady Barker tells of a Scotch girl who, in the middle of last century, was wrongfully accused of theft, was condemned, transported, and captured by pirates. Interesting as it will be found by young people, it would have been found still more interesting by older people had Lady Barker given us copies of some of the old documents from which she has worked up her story. It is curious to find that, when speaking of George II.'s time, she regrets "the grand old simple faith of those times, a faith which these bustling days lack." In spite of Whitefield and Wesley, the chief characteristic of the period of George II. seems to us scarcely to have been grand old simple faith.

Our Autumn Holiday on French Rivers, by J. L. Molloy. With illustrations by Linley Sambourne. (Bradbury, Agnew, and Co.).—The four friends and their dog Gyp who took this autumn holiday on the Seine and the Loire so thoroughly enjoyed themselves that the reader of their tour, however critical he may be, cannot but enter into their enjoyment himself. In spite of the boating slang the narrative is very lively, while the illustrations are not unworthy of the narrative.

Walking and Working; or, from Girlhood to Womanhood, by Mrs. G. S. Reaney. (King and Co.).—This story for young girls will be liked by those who like the *Record*. While the parent reads the columns of that religious and charitable paper, his little daughter could not do better than read by his side this religious and charitable story. A baby is lying to all appearances at death's door. The old grandmother, whose ideas of God are certainly

remarkable, prays, "Heavenly Father, just tell Death to take the old one and leave the babe." She at once dies and the child recovers. We are reminded of Xerxes's wife who slaughtered a dozen or so of young men and maidens in the hope that Death would be satisfied for a time and spare her.

The Hanging of the Crane, by H. W. Longfellow. With illustrations. (Routledge and Sons).—The two artists and the two engravers who have illustrated Mr. Longfellow's poem have done their work in a manner not unworthy of the poet. Miss Mallock's figure drawings are graceful, and Mr. T. Moran's landscapes are pretty enough.

Dr. Ox's Experiment, and other Stories. Translated from the French of Jules Verne. With numerous illustrations. (Samson Low and Co.).—We have here a collection of four very humorous stories by Jules Verne. The first of the stories is perhaps the best, though all are good. A heavy, dull, peaceable race of men, by breathing pure oxygen, have suddenly been rendered noisy and quarrelsome, and determine to attack a neighbouring town. The burgomaster and a leading councillor are sent up the belfry to reconnoitre the country. They had formerly been the best of friends, but the air they now breathed had rendered them quarrelsome too. As they begin to mount the stairs they were wrangling, but the oxygenized air ascended to no great height, and before they reached the top they were as friendly and as quiet as ever. They forgot their purpose and spent their time in admiring the prospect. On their descent of course the quarrelsome mood returned. The illustrations are not unworthy of the story.

Stories of Animal Sagacity, by W. H. G. Kingston. With sixty illustrations by Harrison Weir. (Nelson and Sons).—Mr. Kingston's stories are interesting, though they would have been all the better if they had not had morals tacked on to them. We have never yet met, and we hope we never shall meet, a child who would willingly read an application. Happily Mr. Harrison Weir has illustrated the stories and not the morals.

Aunt Louisa's Zoological Gardens. With twenty-four pages of illustrations by Kronheim. (Warne and Co.).—The illustrations are fairly well done, and the accompanying narrative is for the most part clear and simple. "In winter," as we read in the account of "The Bison," "when the cold is severe, the good God causes thick warm hair to cover the entire body of the Bison. At this time, therefore, the skin of the Buffalo is more valuable than in the summer." Whether the Divine goodness is more manifested by the warmth that is imparted to the animal's body, or by the increased value that is given to its skin, is not made so clear as might be desired.

The Insect, by Jules Michelet. With one hundred and forty illustrations by Giacomelli. (Nelson and Sons).—Though the translator has done his part of the work well, yet M. Michelet's poetical essays have of necessity suffered not a little by being turned out of French into English. The sentimentality which passes muster very well in modern French is not always quite so pleasing in English. The book nevertheless will be read with interest while Mr. Giacomelli's illustrations are admirable. So poetical a writer as M. Michelet was fortunate in finding a no less poetical illustrator in Mr. Giacomelli.

Sea Breezes, by the Author of "Knights of the Frozen Sea," &c. With sixty-six illustrations. (Seeley, Jackson, and Halliday).—In the pictures of ships of all ages and all countries that are contained in this little book boys will find, no doubt, much to interest them. The narrative, however, is rather curious than accurate. We are surprised to find an old Captain, while describing the voyage of the Phœnicians right round Africa, exclaim, "There was a voyage for men who had nothing but the pole-star to guide them." The Captain himself had never been south of the Equator, it would seem, if he expected that the pole-star would be seen there. There is some curious speculation on the probability of "our first father Adam having found means to travel on the Euphrates or Tigris." Carthaginians, we are told, colonized Britain, while "some people think also that they discovered the gorilla."

Dog Life. Illustrated by sixteen engravings after Sir Edwin Landseer. (Seeley, Jackson, and Halliday).—This work, to quote from the title-page, contains "narratives exhibiting instinct, intelligence, fidelity, sympathy, attachment, and sorrow." The narratives for the most part are very curious and interesting. It would have been better if the introduction, in which instinct is discussed in four pages, had been left out altogether. Reason scarcely assists us in understanding such a sentence as the following:—"The phrase (instinct) is often applied to another use; namely, to cover a felt inability—a powerlessness to explain or define." We need scarcely say how much the engravings after Landseer add to the value and interest of the book.

The Town Crier: a Christmas Story-book for Young Children, by Florence Montgomery, Author of "Misunderstood" (Bentley and Son).—Miss Montgomery is scarcely so successful in her book this year as she has formerly been. It was difficult, no doubt, to write a story which should be a rival to *Misunderstood* in the affections of young people. The *Town Crier* is meant for very little children. It is a good moral story of almost an old-fashioned kind; but the story stops too often while the author preaches.

The Ocean and its Wonders, by N. M. Ballantyne (Nelson and Sons).—This little book certainly contains a good deal of interesting information, but it is compiled, we should imagine, by a writer who is not altogether master of his subject. On the same page he states that "we are warranted in coming to the conclusion that the ocean nowhere exceeds five miles in depth," and that "there

are profundities in its bosom which have never yet been sounded, and probably never will be." Later on he states that, "as cold water is one of the best non-conductors of heat, the Gulf Stream is thus prevented from losing its caloric," &c. A reader would infer from the whole paragraph that the preservation of its heat by the Gulf Stream depends on the fact that it flows not merely over water, but over cold water.

The Autobiography of a Man-o-War's Bell: a Tale of the Sea, by Lieutenant C. R. Low, (late) R.N. With illustrations. (Routledge).—This is a republication of a story which we criticized in Routledge's Annual for last year. The faults that we then pointed out have not been amended. "I commenced," says the hero of the tale in an early page, "to adopt the habit I have since practised," &c. If boys once "commence" to read such stories as this, they run a great chance of commencing at the same time to adopt the habit of talking big, but foolishly.

Peter Parley's Annual for 1875. With nine coloured illustrations. (Ben. George).—The stories in this Annual are quite harmless, and at least as interesting as stories in an Annual are wont to be. We scarcely follow, however, the author of a paper on the Octopus, where he says:—"How is the word pronounced? Look it out in the lexicon, and see for yourself—*octopous*, having eight feet; an omega, you see, not an omicron, in the middle of the word; so that when we hear any one call the octopus an octopus, we can say internally, 'You have not looked that word out, sir!'"

Routledge's Every Boy's Annual, edited by Edmund Routledge, F.R.G.S. (Routledge and Sons).—This is in every way a bigger Annual than Peter Parley's. It is a bigger book in itself, and has bigger tales, bigger incidents, bigger pictures, and bigger words. It is, however, scarcely less harmless.

An Almanac and Handbook for Ireland, by Charles Eason. (Dublin: Smith and Son. London: Simpkin, Marshall, and Co.).—Though only in its second year, this Almanac already deserves to take a high place. It has been planned with considerable judgment, and seems to have been executed with great care. To the tourist it affords useful information both as to the routes he should select and the trains he should go by. Should he be an angler, he will find in a short sketch of the angling districts all the information he could require. It gives him also a convenient and clear summary of the characteristics of the more important towns. The student of contemporaneous history will find under the head of "Statistics of Ireland" a great deal of very valuable information put together in a most convenient form. We hope that Mr. Eason's example will be followed, and that in other parts of the British Empire local almanacs may be produced containing an equal amount of local information.

FRENCH LITERATURE.

GRAMMARS and anthologies bearing upon mediæval and Renaissance lore are now almost of daily occurrence, and help of every kind is afforded to readers who wish to become acquainted with a part of the literary world hitherto imperfectly known to young students. It may seem hardly credible, but it is the fact, that until quite lately the pupils of the French Colleges and Lycées were not officially taught to admire any other writers than those of the seventeenth and eighteenth centuries; Malherbe was their starting-point, and André Chénier their extreme limit on this side; all the period before the *Stances à Duperrier* and since the *Jeune captive* was entirely neglected. The present Minister of Public Instruction, however, has changed all that, and now, thanks to M. de Cumont, excursions into the sixteenth century are not only allowed, but prescribed. This innovation has suggested to M. Brachet an excellent little book* containing choice extracts from seventeen poets and twenty-one prose writers, beginning with Pierre Gringore and ending with St. François de Sales. This small volume, compiled with the author's usual accuracy and scholarship, is introduced by a detailed French grammar of the sixteenth-century language; the specimens come next; and, finally, we have a philological and historical commentary, followed by a glossary. M. Brachet has carefully avoided giving too erudite a character to his work; it is intended chiefly, if not exclusively, for beginners, and is therefore essentially of a practical nature.

The *Nouvelle grammaire française*†, for which we are indebted to the same writer, is also a treatise to be placed in the hands of young people belonging to the Lycées. Every one who seriously thinks on the subject must be driven to the conclusion that the historical method is the only safe and rational way of teaching grammar; boys remember much more easily things which they understand; not to add that, as the French of the present day is derived from that of earlier times, we must have some knowledge of the one in order to be able to account for the other. And yet it is not so very long ago that schoolmasters wedded to routine persisted in asserting that the historical study of the French language was, for young pupils, absolute waste of time, and that nothing was wanted but a training in the knowledge of colloquial French. M. Brachet has no difficulty in exploding this absurd idea, and he abundantly proves that no more time need be spent in doing a thing properly

* *Morceaux choisis des écrivains français du seizième siècle*. Par A. Brachet. Paris and London: L. Hachette & Co.

† *Nouvelle grammaire française*. Par A. Brachet. Paris and London: Hachette & Co.

and rationally than in taking the wrong road to knowledge. Pupils and teachers have now, indeed, to be cautioned against the danger of going too far in the opposite direction, and introducing comparative grammar and Aryan etymologies *à tort et à travers*. M. Brachet is equally strong against these enthusiasts, and shows the necessity of keeping steadily on the track marked out by MM. Burnouf, Eggor, and other experienced philologists. The grammar itself is extremely simple, and is so printed that the pupil's various stages of proficiency can be always kept in view. The notes are given in large type, whilst the historical and philological developments which may be introduced and explained as circumstances suggest appear in smaller characters. A companion volume of exercises is announced by the publishers.

When M. Brachet has finished his collection of French extracts with the series which he promises on mediæval writers, he will have placed within the reach of students all the necessary help towards a complete knowledge of the French language and literature. In the meanwhile M. Gidel's admirable handbook covers exactly the ground which M. Brachet has as yet left unoccupied.* It is a history of mediæval French, comprising not merely grammatical details, but a continuous narrative, divided into chapters, and illustrated by a large number of extracts. We are glad to see that M. Gidel does not neglect the Troubadours. Some critics look upon the Langue d'Oc as having nothing to do with French literature properly so called, and as being a kind of transient phenomenon which the crusade against the Albigenses destroyed for ever. It is indeed true that Provençal culture was of relatively short duration; but that is no reason why it should not be taken notice of; and the poetry of the Troubadours well deserves attention, to say nothing of the philology of an idiom which is still used in the southern provinces of France. M. Gidel devotes a distinct chapter to this interesting subject. Supported by the authority of such men as Raynouard, Fauriel, and Ozanam, he introduces us to the numerous forms of composition cultivated by the Troubadours; he describes the *sirvente*, the *tenson*, the *sixtine*, the *aubade*, &c., &c., and quotes choice specimens from the works of Gacebrun Faydit, Bertrand de Born, Savarie de Mauldon, and others. The *chansons de geste* come next, followed by the *romans d'aventure*, and the cycle of the Round Table. M. Gidel's summary of the leading characteristics of each style of composition is always put in as brief and clear a manner as possible; and the specimens introduced are accompanied by translations which will be found of considerable use. Another noticeable merit of this volume is the frequent reference to well-known guides and authorities on French mediæval literature. MM. Dammou, Gautier, Littré, Leclerc, Guessard, Brachet, are constantly quoted, and M. Gidel has taken care to transcribe his extracts of mediæval works from the best editions.

The *Bibliothèque elzévirienne*, at present continued by M. Paul Daffis, has recently been enriched by the addition of two authors belonging to the one to the thirteenth century, the other to the sixteenth. About forty years ago M. Jubinal published the works of Rutebeuf in two octavo volumes; he now re-edits them, and, if we might trust the title-page †, his previous labours have been revised and corrected. We are sorry to say, however, that blunders which disfigured the former edition are religiously preserved in this, and the only alterations we have noticed appear in the preface and the explanatory notes. Rutebeuf is one of the most remarkable of the French *trouvères*, and yet very little is known about him. Some critics have even questioned whether his name was not a *sobriquet*, such as were so often used in those times; Villon, for instance, is a pseudonym which conceals the mediæval *garçole* named Corbueil; Rutebeuf (Rutebeuf, Rutebuis, Rutebuis) probably was the *nom de plume* of the author to whom we are indebted to the *Nouvelle complainte d'outre-mer*. At all events our poet deserves to be remembered, not only as a witty and brilliant writer, but also because he supplies abundant evidence on the history of his own times. M. Jubinal aptly remarks that on several points he completes Joinville's *Histoire de Saint-Louis*; thus he gives us many details respecting Geoffroy de Sargines, Thibaut V., the Count of Poitiers, &c., &c. Moreover, his allusions to numerous contemporaneous events, the satirical shafts which he aims at prelates, monks, nuns, knights, and princes, and his descriptions of customs and usages, give exceptional value to his compositions. He may be briefly characterized as the Saint-Simon, or rather the Béranger, of the thirteenth century. The present volume contains, in addition to the biographical notices, thirty-one poems of Rutebeuf.

Noël du Fail, Sieur de la Hérissey ‡, is another writer whose works should be known by all who care for old French literature, and he has found in M. Assézat a very competent editor. Unfortunately, in his case, as in that of Rutebeuf, biographical details are totally wanting, and we are reduced to draw inferences from various particulars contained in the author's works. That is what M. Assézat has done. Those who read his preface will perhaps be inclined to think that very little indeed has been brought to light respecting Noël du Fail, and we are quite of their opinion; but we must remember the proverb "à l'impossible nul n'est tenu," and for our part we are satisfied that the learned editor has done his best. The Sieur de la Hérissey belongs to the tribe of humorists

headed by Rabelais, and which boasts of such representatives as Bonaventure Despériers, Béroalde de Verville, and Thibout des Accords. In his *Tableau de la poésie française au XVI^e siècle*, M. Sainte-Beuve had ventured to speak somewhat slightly of the *Badiverneries d'Eutrapel*; whereupon M. Assézat supports his opinion by a detailed analysis of Du Fail's writings. Referring the reader to the preface of the first volume, we shall merely add here that the works published and annotated for the *Bibliothèque elzévirienne* of M. P. Daffis are—(1) the *Propos rustiques*; (2) the *Badiverneries ou contes nouvelez*; (3) the *Contes et discours d'Eutrapel*. The second volume contains a copious philological and historical index. With all the learning and humour of Rabelais, Noël du Fail combines much tenderness and a keen appreciation of the beauties of nature; on the other hand, whilst he is full of fun and enjoys a good joke, he has not the coarseness of *Joyeux devis* and of the *Moyen de parvenir*.

M. Alexandre Weill* writes on the paper cover of his book, "Aucun homme sérieux, de n'importe quel parti, ne comprendra bien la portée des événements actuels, sans avoir lu cette histoire." In the author's opinion, society is now situated precisely as it was three hundred years ago, and the Communists of the present day can trace back their ancestry to the Republican Anabaptists so vigorously denounced by Luther. M. Weill devotes a long introduction to a statement of the various points of difference which existed between the Roman Catholics, the Anabaptists, and the Lutherans; he shows what he considers to be the errors of each party, and he concludes by remarking that the views maintained by Munzer and his adherents had for their foundation a principle subversive of society and contrary to all the laws of nature. This principle is stated by M. Weill in the following terms:—"Man is born or regenerated good. The word of God is sufficient for him. He has no need of that element of force which is called justice. Every authority derived from the power of the sword—that is to say, from duty made obligatory—is unlawful, null *ipso facto*, and must be destroyed." It is unnecessary to examine M. Weill's refutation of an absurd and anarchical paradox.

M. Ferdinand Hoefert† has added another volume to his handbooks on the history of science. Mathematics form the subject of his present publication, and, in a succinct but sufficiently complete exposition, he describes the progress of that branch of knowledge from the earliest epoch to our own day. The introductory chapters treat of the origin of the science of numbers, and take us at once out of the region of those *à priori* theories which have proved so fatal to sound knowledge. The Eastern nations then come under notice, and an account of the Greeks and Arabs, considered as mathematicians, brings us to the philosophers of the middle ages, and finally to those of modern times. M. Hoefert enters into all necessary details respecting the most important discoveries; he illustrates his statements by woodcuts, and the bibliographical indications contained in the notes enable the student to consult for himself the various authors referred to.

Amongst the scientific books we have lately received two or three important ones deserve mention here. M. Réal's *Traité de mécanique générale*‡ may be regarded as an introduction to the science of mechanics in its various applications. It is divided into three parts, treating respectively—(1) of motion studied independently of its causes; (2) of the motion of material systems; (3) of thermodynamics. The work is to consist of two volumes, the first of which only is now before us. M. Réal explains the different theories put forward by the best authorities of our own day, such as MM. Poincaré, Bertrand, Yvon Villarceau, and Maurice Lévy, and he has especially added new remarks to the part bearing upon thermodynamics, completing it by a theory of projectiles in fire-arms. The second volume is announced as in the press.

Captain Picardat§ discourses of mines in their connexion with war operations on a field of battle. It is a subject totally distinct from that of siege operations; and its treatment does not require the same special knowledge and experience. An officer of engineers alone is competent to direct and work mining operations in the attack on a town or fortress. On the other hand, any officer, says M. Picardat, ought to be able to carry out such operations in their relation to ordinary field warfare, and the purpose of the present volume is to explain the best means of doing so. After a short preface on the various plans proposed by engineers and chemists, our author suggests some views of his own, examining successively the resources resulting from the use of pyrotechnic preparations, and those derived from the appliance of electricity.

The ravages occasioned by the Phylloxera amongst the vineyards give special importance to M. Maurice Girard's pamphlet, which describes the nature of the disease and discusses the best means of preventing it.||

Under the title of *Premiers Lundis*¶ M. Jules Troubat has collected the early articles contributed by M. Sainte-Beuve to the *Globe* newspaper, and to sundry other journals, before he had

joined the *Revue de Paris*, and subsequently the *Revue des Deux Mondes*. It is interesting to watch the first efforts of a critic who was destined to obtain so brilliant a reputation, and to compare the crudeness of his early performances with the finish of the later *causeries*. M. Troubat deserves our thanks for the zeal with which he endeavours to rescue from oblivion every monument of M. Sainte-Beuve's indefatigable industry; the preface to his volume gives us a number of interesting details as to the author's connexion with the *Globe* and the *National*, and many of the articles now brought together for the first time have a special interest in connexion with those already known to the public. Thus two papers on M. Victor Hugo's *Odes et ballades* show us the critic judging with some amount of severity, but fairly on the whole, the poet for whom he afterwards professed so great an admiration. The article on *Joseph Delorme* is extremely amusing, because it is not often that we find an author sitting in judgment upon his own works, and characterizing them with so much truth. We are not told to how many volumes the *Premiers Lundis* will extend, but there must be still a goodly array of M. Sainte-Beuve's criticisms to disinter from the columns of the newspapers where they lie buried. In the meanwhile M. Troubat is also busy in collecting Sainte-Beuve's letters; and we may expect much valuable information from the publication he announces.

M. Odysse Barot's sketch of English literature* is a pleasant volume which we can heartily recommend to readers who have no leisure for a perusal of M. Taine's larger work. As the title says, the author deals specially with the literary movement of our own day; but it would of course be impossible to appreciate this thoroughly without a reference to previous culture, and the remark which M. Brachet makes *à propos* of France is equally applicable here. Accordingly M. Barot begins with a retrospect of English literature, divided into three chapters treating respectively of the period before the Commonwealth, that between the Restoration and the French Revolution, and the forty years commencing with 1800. Extracts are given in sufficient number to show the style of the various authors, and an alphabetical index concludes the volume.

The dedication of a work on Rome and Church politics to M. Edmond About† shows sufficiently in what spirit it is written; we must own, however, that M. Jung nowhere displays that flippancy which so frequently spoils M. About's arguments, and prejudices serious people against them. He seeks to point out the danger which France would run by adopting Ultramontane views, and he particularly insists on the idea that a close alliance between Royalty and the Vatican, as the latter is now governed, would be fatal to the former. The policy of the old French Monarchy was diametrically opposite to that which some imprudent statesmen now favour; and Henry IV., Richelieu, and Louis XIII. were better inspired than Charles X. when they adopted openly and firmly the principles of Gallicanism. M. Jung explains with much clearness the conflicts between Rome and the Court of Versailles under Louis XIV.; he then describes the political arrangements which led to the assembly of the French clergy in 1682, and subsequently to the Concordat of 1801; finally, he places before us the present state of affairs at Rome, and in the appendix to his interesting volume he reprints a number of valuable illustrative documents.

The memoirs of Count Miot de Melito‡, now published in a cheaper form, but without any alteration, do not require any notice here. We may for the same reason pass over a reprint of M. Ampère's interesting *Journal et correspondance*§.

We have received a long answer of M. Étienne Arago|| to the attacks made upon him by the *Commissions d'enquête parlementaire* organized to investigate the conduct of the Government of September 4th. Many members of that Government, amongst others M. Jules Simon, have already pleaded their cause at the bar of the country. The Mayor of Paris now steps forward and endeavours to show that during the period of his administration he never failed to do his duty. The accusation of conniving at the designs of the demagogues of the Commune has often been brought, not only against M. Arago, but also against his colleagues of the Paris municipality; it may or may not be true, but we think it cannot be denied that great weakness was manifested at the Hôtel de Ville, and M. Arago's elaborate defence does not sufficiently clear him from blame on that score.

M. Nisard¶ takes us back to classical times; his brilliant sketches of Tacitus, Livy, Sallust, and Cæsar give us an excellent idea of the four great historians of ancient Rome, and treat them as representatives of different classes of writers. The essay on Cæsar was partly suggested by Napoleon III.'s work, which M. Nisard had to review.

M. Nourrisson's monograph on Machiavel** cannot fail to excite much interest, and it deserves to be noticed as one of the best contributions lately published on the history of Italy during the sixteenth century.

¶ *Les quatre grands historiens latins*. Par D. Nisard. Paris: Lévy.

** *Machiavel*. Par Nourrisson. Paris: Didot.

The new instalment of the *Bibliothèque universelle** contains the usual proportion of useful articles, and we would name especially M. Vincent's essay on John Stuart Mill. The English philosopher will for a long time to come excite the curiosity of Continental writers, who are not so likely as ourselves to be biassed by prepossessions both of a literary and of a political nature.

Novels abound as usual. Those which have any pretensions to originality show, with a very few exceptions†, a firm resolve on the part of the authors to borrow their inspirations from questionable types of modern civilization‡; the others are mere reprints of works which have already obtained a deplorable amount of celebrity. M. Gustave Flaubert's *Salammô*§, given, when it first appeared, as an archaeological and historical romance, turns out to be a mere work of fancy, rendered attractive by a pretentious appearance of accuracy, but as full of blunders as the famous *Tentation de Saint-Antoine* which we noticed some time ago. M. Champfleury's *Aventures de mademoiselle Mariette*|| is likewise an old story, considered by some critics to be the masterpiece of the realist school. It would bid fair to be the typical novel of the nineteenth century if there were not, unfortunately, a few antiquated persons who persist in thinking that the ideal of art must not be sought in the gutter.

PRINCE BISMARCK AND HIS ENEMIES.

WHEN France was overrun by her conquerors, the French were especially struck with one custom which they observed to prevail among the invaders. If a private soldier happened to displease an officer, his superior forthwith gave him a good beating, as if he were a slave or a dog. To a Frenchman of the humblest degree this would have been a mortal insult, but the French observed that the German soldiers took their punishment as a matter of course, and as the most natural thing in the world. It was merely a way of behaving that was in fashion in Germany. Prince BISMARCK is the representative man of Germany, and no German custom comes amiss to him. When anything happens in the German Parliament to provoke him, he behaves like an angry German officer who thinks that a private soldier has been impertinent to him. He lays about him right and left. He does not indeed use his fist. But he uses the whip of a very abusive tongue. He has no anxious thoughts about his dignity, or about the respect due to the representatives of his nation. He says what he pleases, and cares for nothing but his own stinging. The strange scene that was witnessed last week in Berlin could not have been seen in any other Parliament than a German one, and Prince BISMARCK's brothers and friends in arms considered that he laid about him in a very handsome and telling manner, and had given a very proper dressing to a pestilent Ultramontane who had shown much the same insubordination as a private soldier who had ventured to appropriate a clock to which his commanding officer had taken a fancy. We must be content to adopt the philosophy of the French, and to say that, if these are German manners, the Germans are welcome to them. Prince BISMARCK is the greatest subject in Europe, and yet, being a German among Germans, he chose to rival the violence and personalities of a drayman. But then he is a German; he was speaking in a German Parliament, and it was a German whom he abused. And if we once accept the situation, and look on things from the standpoint of Berlin, we must say that the PRINCE was, on the whole, right. The member who offended him was a scarcely concealed enemy, not only of Prince BISMARCK, but of the German Empire. He was a friend of the Ultramontane enemies of Prince BISMARCK, and had recently stated in his place as a member of the Bavarian Parliament that it was no use raising fresh soldiers for Germany, as in the next war they would all desert. He chose to speak of KULLMANN as a maniac. He attributed the recognition of Spain to Prince BISMARCK's anger at the attempt made to assassinate him. He spoke of Russia as alienated altogether from Germany. He depicted Prince BISMARCK as constantly endeavouring to stir up bad blood with France, and to provoke a new war; and he complained that the Foreign Affairs Committee of the State Council was never called together, and that Prince BISMARCK managed matters exactly as he pleased, without ever giving the representatives of the minor States an opportunity of discussing his policy or knowing what it was. In short, he strung together everything he could think of that would be most likely to irritate the PRINCE, and to lower his reputation. He, as it were, went off with Prince BISMARCK's clock publicly, and held it aloft in his exultation. Prince BISMARCK was down on him in a moment, and banged him about as if he had been a larcenous private soldier.

The PRINCE's answer was substantially very simple. Everything that he does to shape the foreign policy of Germany is immediately made known to the members of

the Foreign Affairs Committee, any one of whom might call the Committee together if he pleased. But, as no one thinks of questioning what Prince BISMARCK considers right, the Committee never meets; and this is very natural, for the representatives of the minor States know that Prince BISMARCK would get his own way however much the Committee might meet, and to seem to question his exclusive authority might be taken as indicative of a wish to show that he has not all Germany with him; and as things now stand, he has all Germany with him in the sense that the minor States see no course before them but to follow his lead. In return, statesmen from the minor States are associated with him in carrying out his policy, and more particularly the late Bavarian Premier has been made Ambassador at Paris. The recognition of Spain was simply a set-off to the murder of SCHMIDT. Prince BISMARCK is delighted to say that the days are gone by when foreigners could maltreat Germans with impunity. It is now as dangerous to touch a German as it used to be to hurt the hair of an Englishman's or an American's head. The recognition of Spain was not, indeed, as Prince BISMARCK candidly avowed, the form of reprisal for the murder of SCHMIDT which would have gratified his natural man. What he would have really liked to do was to have sent a German gunboat to Spain, captured some Carlist officer or other, and hanged him up on the sea-shore. But we are too pacific nowadays for that sort of thing, and so, instead of a chance Carlist being hanged, SPERRANO was recognized. Russia would not do as Germany had done; but then SCHMIDT was not a Russian; and as to Russia and Germany, they had been close friends for a century, and their relations are too well established to be "hurt by Lilliputian shots." This was one of the bangs given to the Bavarian private, and in one sense it was certainly very heavy. But calling KULLMANN a maniac was what most hurt the PRINCE's feelings. KULLMANN was not a maniac. He was a very sensible man in his way, and Prince BISMARCK had a most instructive conversation with him, in which the assassin explained that he had no animosity whatever against the PRINCE personally, but had tried to kill him because Prince BISMARCK had offended his party; and KULLMANN went on to say that his party was the Centre party, so that, as the PRINCE declared, KULLMANN did belong to the party of his Parliamentary adversaries, and will stick to their coat-tails however much they may try to get rid of him. This is in a way perfectly true. KULLMANN sticks to the coat-tails of the Ultramontanes just in the way in which the members of the Archbishop of Paris stick to the coat-tails of the Republican party in France. The bitterness of political warfare impels the fanaticism or shelters the ruffianism of a few extreme men, and it is inevitable that the deeds of these extreme men should taint the reputation of many who sincerely abhor and lament what they do. And even they are very often ready to palliate atrocities, and to seek for their origin in the conduct of political adversaries. The leading spokesman of the Ultramontanes, Herr WINSTHOFER, followed Prince BISMARCK, and tried to come to the relief of his Bavarian ally. But he was soon demolished by the PRINCE, who brought to his recollection that he had quoted KULLMANN on the ground that he acted under excitement, and that this excitement must be laid to the door of those who had first awakened it. Leaving taste and manners and the dignity of the Chancery out of the question, it must be acknowledged that Prince BISMARCK had much the best of the encounter.

The next day the PRINCE made another great speech,

but this time he had no personal enemy to attack. It was the whole Ultramontane party, and the Pope as its head, that he challenged. The German Government has come to the resolution to cancel the post of Envoy to the Vatican; and this is done partly because, the Pope having now no temporal sovereignty, there is no particular occasion for having an Envoy accredited to him, but principally to make known to all the world that the Pope is, and long has been, the enemy of Germany. To demonstrate this, Prince BISMARCK gave his history of the origin of the war with France. The disposition of Rome to see its best chance of carrying its ends in fostering the embarrassments of the Powers it distrusts was illustrated by a piece of secret history which Prince BISMARCK thought he might now properly reveal. In 1869 Würtemberg happened to have some cause of remonstrance with Rome, and the Papal Nuncio informed the Würtemberg Envoy that it was only in America, and perhaps England and Belgium, that the Church was free. "In all other countries the Church had to look to revolution as the sole means of securing her rightful position." In complete accordance with this policy the Emperor NAPOLEON was driven by the clerical party into the war which cost him his throne. This has often been surmised, but Prince BISMARCK now states it as a positive fact to which he can testify. The Emperor was dragged into the war by the Jesuits. He struggled hard to resist the influences which the Jesuits brought to bear on him. In the eleventh hour he determined to maintain peace, and he stuck to this determination for thirty minutes. Then he succumbed, and war was declared to please Rome; and Prince BISMARCK states that he is in possession of conclusive evidence to show that, if France had been successful, the Œcumenical Council was intended to resume its sittings and come to votes very different from those at which it had arrived before the war suspended its operations. What this comes to is that, while others believe, Prince BISMARCK knows, that the party dominant at Rome actively engages in intrigues the object of which is to bring about political changes by revolutionary wars and other violent means. That Rome has always claimed the right to exercise some sort of power, direct or indirect, over temporal sovereigns, is beyond question, and any one who is not familiar with the history of the questions to which this pretension has given rise may find his wants supplied in a letter contained in the current number of *Macmillan's Magazine*, which is as lively and vigorous in style as it is forcible in reasoning and rich in knowledge. The point that really comes home to each nation is not whether Rome considers itself authorized to interfere in temporal affairs generally, but whether at the present moment Rome is actually interfering in their temporal affairs and striving to bring about as against them a political revolution, or war, or some great catastrophe, in the interest of the Church. Prince BISMARCK states in the most unequivocal way that such interference is now going on, and for at least five years has been going on, with regard to Germany, and the majority of the German Parliament fully believe him. The consequence is that the excitement with causing which his Ultramontane adversary taunted Prince BISMARCK is very fierce in Germany just now, and very widely spread; and it so happens that at the present moment to the excitement of a religious struggle is added the excitement of the trial of Count ARNIM. We now know what are the precise charges against Count ARNIM, but the real gravity and pertinency of those charges can hardly be fairly estimated until light has been thrown on the evidence which may be produced both against Count ARNIM and for him.

PRESIDENT GRANT'S MESSAGE.

THE people of the United States are about to suspend for a year with cheerful indifference the operations of the Federal Legislature. The Congress which has just been elected will meet for business in December 1875, and the outgoing Congress, though it will sit for two or three months from the present time, will pass no measure of importance. It is said that General BUTLER, before retiring from public life, will attempt to force the unlucky Civil Rights Bill through the House of Representatives; but his party will not be enthusiastic in favour of a scheme which has, according to common belief, been a principal cause of their defeat. Even if the House and the Senate should pass

the Bill, it will be stopped by the PRESIDENT'S Veto, which the ultra-Republicans are not strong enough to overrule. The absence of any habitual need of Federal legislation is one of the many advantages of the social and political condition of the United States. The local Legislatures deal with many questions which would in England require the attention of Parliament; but organic changes are seldom attempted, and on the whole no community is so little troubled either with new laws or with official interference. The questions which excite interest in Congress are often merely conventional issues on which parties tacitly agree to try their strength. The Civil Rights Bill, which owes its origin to the factions philanthropy of Mr. SUMNER, would be an anomaly in American legislation, as it would come at every point into collision with personal feelings and social habits. The more practical measures relating to trade and currency which must ultimately be the subject of legislation will be by general consent adjourned. The policy of the party which has lately become dominant is not yet declared, nor even determined; and the Republican majority of the present Congress will gladly devolve on their successors the responsibility of meeting economical and financial difficulties. The divisions of opinion on the debt, on the tariff, and on the resumption of specie payments will not coincide with party distinctions. The representatives of different States will advocate the wishes and supposed interests of their respective constituencies with but incidental regard to political classifications. The elections have on the whole perhaps been favourable to sounder commercial theories than those which have generally been adopted by the Republicans; but the Democratic party is not unanimous in favour of Free-trade, and some of its members would not object to an inflation of the currency.

The telegraphic summary of the PRESIDENT'S Message is not remarkably interesting. In pursuance of his former policy General GRANT urges at considerable length the early resumption of specie payments. He has evidently during his six years' tenure of office learned to appreciate the importance of economical and monetary questions, and he has made praiseworthy efforts to understand the difficult subject of the currency. His veto of the Bill for an increased issue of paper money was founded on the just assumption that the proposed inflation would postpone the return to a gold currency. Ingenious journalists who attributed to the PRESIDENT expressions of regret for his resistance to an increased paper circulation have apparently relied on their own invention. He now recommends the early repeal of the legal tender clause; and in the accompanying Report of the SECRETARY of the TREASURY certain measures are suggested for breaking the shock of the change in favour of debtors who might otherwise be injuriously affected. Mr. BRISTOW expects with good reason that the abolition of paper as a legal tender will attract gold into the United States; and he also relies on large issues of notes payable on demand as an auxiliary circulating medium. Both the PRESIDENT and the SECRETARY of the TREASURY recommend that, on the resumption of specie payments, the restrictions at present imposed on the issue of bank-notes should be modified or withdrawn. It is uncertain whether, in proposing that the banks should be afterwards free, they intend to favour an unlimited issue of private bank-notes. English experience shows that such a practice is hazardous; but, on the other hand, the paper currency of the Scotch banks is preferred by the population to gold. The PRESIDENT is probably too sanguine in thinking it possible to restore a gold currency by the beginning of 1876. There will during the greater part of the interval be no Congress to pass the necessary measures, nor perhaps is the community prepared for the change. Whenever it is effected all the money-markets of the world will be seriously disturbed by the additional demand for bullion; but the Treasury of the United States will probably have provided a large accumulation of gold before the resumption is undertaken.

A Washington paper which is said to be for some purposes an organ of the PRESIDENT lately proposed, as a mode of retrieving the fortunes of the Republican party, a large distribution of public money under colour of a scheme for the construction of public works. The attempt would have been too audacious to succeed, and the suggestion may probably have been unauthorized. If it was put forward for the purpose of testing public opinion, the PRESIDENT and his advisers have probably discovered that a plan for bribing the people with their own money was

not likely to conciliate public favour. Although General GRANT himself attributes the political reaction to the unreasonable agitation of the Civil Rights Bill, there is no doubt that he has himself contributed to the disasters which have befallen his party by the tolerance which he has shown to corruption. His most powerful allies were discredited by their connexion with some of the scandalous proceedings which have been denounced by all impartial judges. The retrospective operation of the Salary Bill, the appointment of low partisans to lucrative offices, the complicity of two successive Secretaries of the Treasury in the affair of the SANBORN contract, and, above all, the connexion of some members of his own family with questionable transactions, have produced a general impression that the PRESIDENT was at least indifferent to the maintenance of political and official purity. While his party was still undisturbed in its political supremacy, his proposal of a gigantic scheme of internal water communication was received with coldness, and there can be no doubt that any revival of similar projects would have been generally scouted. The history of the *Crédit Mobilier* in connexion with the Pacific Railway proved the difficulty of securing the honest administration of the public funds in dealings with speculative capitalists and contractors. The Message contains no reference to a policy which may perhaps never have been sanctioned by the PRESIDENT. The compiler of the telegraphic summary has not thought it necessary to report the PRESIDENT's elaborate apology for the PRESIDENT's conduct in Arkansas and Louisiana. The elections have definitively relieved the Southern States from the Federal control which was exercised for party purposes. The reign of KELLOGG is destined to an early close, and the PRESIDENT has not ventured to decide the dispute between the rival Governments of Arkansas in accordance with party interests.

The only passage which relates to foreign policy might perhaps have been advantageously omitted. The PRESIDENT once more calls attention to the insurrection in Cuba, and hints that it may be necessary to interfere in the contest which Spanish power seems unable to terminate. At the same time he admits that the civil war in Spain forms an excuse for delay, and, "awaiting the result of further negotiation," he defers further communications to Congress on "the subject." Both General GRANT and his predecessors have often used similar language, as when, fifteen or sixteen years ago, Mr. BUCHANAN openly recommended in the interests of slavery the immediate acquisition of Cuba. The most remarkable peculiarity of General GRANT's Message is that he refers to foreign Powers which are supposed to have a common interest with the United States in putting an end to the insurrection. It is for the PRESIDENT and his advisers to reconcile the appeal to foreign Governments with the pretensions which are called by the Americans the MONROE doctrine. It is not in the present case probable that any action will be founded on the PRESIDENT's apparent abandonment of the claim to exclusive influence in the Western hemisphere. England is, with the exception of the United States, the only neutral Power which is likely to take an interest in the affairs of Cuba; and there is not the smallest probability of English interference. During the struggle in the early part of the century between Spain and the South American colonies England and other Powers recognized the insurgent States as belligerents long before their independence was acknowledged. The insurgents in Cuba have never hitherto entitled themselves to be regarded as belligerents, because they have no regular army, and no town or fortress of their own. The Government of the United States may recognize them at its discretion; but it would undertake a costly enterprise of doubtful expediency by taking part in the struggle. Cuba would not be a desirable acquisition, and the part of the population which is now in arms against Spain is incapable of establishing a regular Government. It is highly improbable that the moribund Congress will commit the error of commencing on the eve of its dissolution a policy of ambition; but suspicious critics think it possible that the PRESIDENT's hints on the annexation of Cuba may be addressed rather to the future Democratic majority than to his own party. Simultaneously with the opening of Congress Mr. FISH has in a Note to the Spanish Government recommended the acknowledgment of the independence of Cuba. The communication is the more offensive because the SECRETARY of State professedly disclaims any desire for annexation.

STROUD.

THE disclosures made during the long trial of the Stroud election petition are full of interest of a very painful kind. They suggest that a very considerable number of Englishmen have no notion that anything is wrong or dishonourable by which a seat in Parliament may be won or preserved. How to defeat the law, how to outwit justice, how to secure an end and just avoid the consequences of the means taken to secure it, appears to be the one thought of at least one class of people who undertake to manage elections. Election managers at Stroud had had plenty of warning; but warnings were lost upon them. Party spirit ran high, and party spirit so far blinded men who in calm times and in ordinary business would not do anything obviously wrong that they would rather risk anything than be beaten by their political opponents. At the general election in February two Liberals were returned, thus reversing the decision of the constituency which, by electing Mr. DORRINGTON a few weeks before, had done far more than it could have expected to do; for, by prompting Mr. GLADSTONE to dissolve Parliament, it had brought about a change of Ministry. A petition was lodged and tried, and the two Liberals were unseated. In their place Mr. DORRINGTON and a Liberal were returned; but the more hot-headed of the Liberals were angry at having lost a seat, and petitioned against Mr. DORRINGTON's return. The petition was successful, and Mr. DORRINGTON was replaced by Mr. BRAND. This was the fourth election in one year, and it might have been thought that the teachings of experience would not have been neglected, and that unusual pains would have been taken to conduct everything in the most unexceptionable way. On the contrary, scarcely anything was omitted to make the conduct of the election as discreditable as possible. Mr. BRAND was returned, and we now know how Mr. BRAND's seat was won for him. Every artifice that ingenuity could devise was employed to win the seat by illegal means, and yet keep the sitting member free from responsibility. A secret fund was raised and spent, but it was not intended to pass through the hands of Mr. BRAND's agents. The management of affairs was not entrusted to any one responsible person on Mr. BRAND's behalf. There were agents, but the agents had no distinct functions, and had no communication with each other. They had subordinates under them who worked independently of them, and there was always some irresponsible person at hand who could do anything in the world as if by a sudden inspiration of instinct. Strangers at a long distance were moved by a mysterious impulse to go to the ends of the earth in connexion with the Stroud election. One resident at Taunton was suddenly seized with a desire to go and canvass a voter at Landore, another to canvass a voter at Birmingham. One stranger betook himself to Cardiff and then to Fulham. It became a sort of axiom that Stroud things should not be done by Stroud people. There were strangers to do everything—strangers to watch Stroud public-houses; strangers to watch the arrival of the trains; strangers to walk about platforms and suggest that sovereigns might be had easily for expenses. We used to hear in old days of the Man of the Moon who, on the evening before an election in a corrupt borough, arrived at a low public-house with bags of gold. But last summer it seemed as if the whole population of the moon, if there is any, had taken it into their heads to come to the earth and to stroll about trying to get Mr. BRAND in for Stroud.

What makes the history of these proceedings particularly instructive is that the combination was very nearly successful. The case of Stroud is entirely different from the old familiar cases in which a rich man wanting to get into Parliament boldly bribed a constituency, or his agents bribed for him, trusting that he would be sure to pay the bill afterwards. At Stroud it was not Mr. BRAND who wanted to get into Parliament by illegal means, but a number of unscrupulous men who determined to get him in by illegal means. What they wanted was not the personal friendship of Mr. BRAND, but that their man should win, and their local enemies be defeated; that they should be able to pace about Stroud with the air of conquering heroes. They had money, and party spirit made them glad to part with their money to gain ends of their own. Of course Baron PIGOTT pronounced Mr. BRAND perfectly clear of any suspicion of having himself authorized what had been done. It is indispensable for those who want to win an

election on their own account to have a candidate who is as honourable and innocent as possible. He is to know nothing; his agents are, if possible, to know nothing and do nothing. The great object is to exempt the sitting member and his agents from all responsibility. The counsel for the sitting member will then, if a petition is lodged, be able to ask, as the counsel for Mr. BRAND repeatedly asked during the trial that has just closed, "What have we to do with all this?" Fortunately it happened that in one clear case a very humble agent of Mr. BRAND was shown to have given half-a-guinea in bribery, and so Mr. BRAND was unseated. But case after case of bribery was proved, and the counsel for the sitting member was able to say complacently, "We are not responsible." It is not, however, merely when an election is going on that audacious attempts to defeat the law are made. When a petition has been lodged things become very critical. The friends of the petitioner try to collect evidence, and they are known to be having some success. The next step is therefore to spirit away the witnesses on whom the petitioner is known to be going to rely. This practice has been resorted to at Stroud with wholesale audacity. Before the petition which lost Mr. DORRINGTON his seat was heard by Baron BRAMWELL, five or six persons were spirited away to Brussels; and before the present petition was tried by Baron PIGOTT, a man named WORKMAN, who had "made a clean breast of it" to a Conservative agent, had been got off safely to America. Justice was so far defeated, and defeated with impunity. The spiriting away of WORKMAN was brought home to a person who had acted as agent of Mr. BRAND at the last election; but this could not void the election, for the question was whether the seat had been obtained by illegal means. That WORKMAN had been bribed at the last election was clear, and that he had been bribed by some one who received letters addressed to an agent of Mr. BRAND was clear, for it was on a hint given in a letter from WORKMAN to this agent that he was open to an offer that a wonderful person from the moon called on WORKMAN and bribed him. But most conveniently the agent did not open his own letters, and how was Mr. BRAND to be responsible for some wicked person opening his agent's letters, and then, without saying a word to the agent, rushing off and bribing one of the agent's correspondents? This is a story worth thinking over, if any one wishes to know what things may be done when it is a political party and not a particular person that is working for a seat. A voter is bribed, and he is bribed because he writes to an agent of the candidate that he would like to be bribed. But there are persons in the office of the agent who intercept the letter and bribe the voter. Afterwards the voter confesses that he has been bribed, and then a large sum is given him to go to America, and he is huddled away secretly out of the borough. This time the agent is privy to the matter, but he is no longer acting as agent. He was agent for the election, but not for the purposes of the petition. Mr. BRAND was held by Baron PIGOTT to be responsible neither for the bribery nor for the abduction of the witness; and if all the cases of illegal practices had but been managed as cleverly as this one was managed, Mr. BRAND would have retained his seat, and the joy of the Liberals of Stroud would have been complete.

It is quite true that members of a political party who do what was done at Stroud subject themselves to certain risks. They may very possibly attain their political end. Their man may win the seat and keep it, although it has been won by bribery and kept by the abduction of witnesses. Still, if their acts could but be brought home to them, they would no doubt be punishable by law. They therefore take as many precautions as they can to avoid being found out. They act through strangers; they send to Taunton if they want to communicate with Birmingham. They probably take very good care to commit themselves to no one who is not devoted to their interests, who would not have to share their punishment with them, and who would not be willing to go off to America if danger threatened. But this is not really the only protection they enjoy. Who is to prosecute them? They know that prosecutions for malpractices at election time would be very unpopular. They know that their political adversaries have their own sins to answer for, and that every one has cogent reasons for keeping quiet. They rely on the unwillingness of fellow-townsmen to take any very harsh measures. They are aware that the House of Commons is very tender

over election offences. The House of Commons is under the guidance of the Ministry of the day, and the Ministry is very apt to shrink from the reproach of putting the law in motion against political adversaries. Even the judge is not free. He is only the agent of the House of Commons, and the power of the House is delegated to him avowedly as a temporary expedient. Baron PIGOTT detected one case of clear indisputable perjury committed before him. The proper function of a judge who sees perjury committed before him so distinctly that he publicly states it to be perjury is at once to order the offender to be prosecuted. But Baron PIGOTT merely quoted an appropriate saying about perjurers stammering, and indulged in a general moral reflection upon the iniquities to which political partisanship can give rise. Every one, from the Prime Minister to the lowest stranger from Taunton, is penetrated with a belief which centuries of lax conduct have instilled into the English mind, that an election is like a branch of mistletoe, and that things may be done under its shelter which elsewhere would be thought very rude and naughty. It has been suggested that the writ for a new election at Stroud should be delayed for a considerable time; and if such a proceeding would ever be justifiable, the peculiarities of the recent history of Stroud would be as good a justification for it as possible. But, to say nothing of the constitutional objections to such a proceeding, which are not perhaps very strong, it certainly seems as if this would be rather too handsome a reward to the Stroud Liberals for their goings-on. They would not have got their man in, but they would have succeeded in keeping out the man of the other side. The sitting member for Stroud is a Liberal, and although Stroud has twice within a few months returned a Conservative, yet, if no writ were issued, the effect would be that during the present Parliament, the whole representation of the borough would be banded over to the Liberals. The secret fund would not have been spent, nor all the strangers employed, in vain. Stroud would have been reduced to the position of a borough returning one member, and that member a Liberal. It would seem better at once for Stroud and the nation to take this opportunity of strengthening the hands of the law a little. If election judges were invited to order prosecutions for manifest perjury committed in their presence, and if the abduction of witnesses prepared to give evidence on a petition was made a statutable offence, prosecutions for which were a matter of course, and not merely of the discretion of the House of Commons or the Ministry, the history of the Stroud petition would not have been told without a useful moral being added to it.

RUSSIAN DESIGNS ON TURKEY.

THE explanation of Russian designs on Turkey which has lately been published in the St. Petersburg *Golos* is probably accurate, if it is not official. The newspaper press, which sometimes worries and alarms Constitutional Ministers, is one of the handiest and most useful instruments of a despotic Government. Although Russian journals never publish anything distasteful to the authorities, they can always be disavowed. If it is desired either to deceive foreign States, or to accustom them to schemes not yet formally avowed, an article in a newspaper is a more convenient form of communication than a despatch. Another advantage of inspired journals is that they seem to suggest as the national wish any policy which the Government may desire to recommend to its subjects. Recent experience shows that Russian policy is often announced in newspapers at the same time at which it is officially or extra-officially disavowed. When Count SCHOUVALOFF gave the English Government the personal assurance of the Emperor ALEXANDER that Khiva would be evacuated after it should have been occupied, the journals of St. Petersburg and Moscow ridiculed the suggestion that any Russian conquest could be abandoned in deference to the wishes of England. The event showed that the newspapers were well informed, and that the Emperor and his confidential Envoy were mistaken. It is not improbable that in diplomatic communications the proceedings of Russia in respect to the Austrian Commercial Treaty with Roumania may have been professedly reconciled with the stipulations of treaties, and with the rights of the Turkish Government. The semi-official organ of the Russian Government states,

with calculated cynicism, that the recognition of the claims of the Principalities to conclude treaties without the sanction of the Porte is part of a policy which is to result in the peaceful dismemberment of Turkey. Russia, in the conventional phrase, always retains her interest in the welfare of the Christian subjects of Turkey. As the Porte exercises no kind of control over the domestic affairs of the Principalities, intervention in the matter of a commercial treaty can scarcely proceed from pure philanthropy.

One of the purposes of the manifesto is to proclaim the continuance of the union which has been established among the three great military Empires; and it is at least possible that, under the form of professions of confidence, the Russian Government may intend to convey a hint to one of its two allies. The concurrence of Germany with Austria is attributed to two motives which are equally imaginary. It is supposed that Prince BISMARCK may have wished to show his gratitude for the recognition of SERRANO, and that he may also have desired to make himself a party to an Oriental arrangement. The relations between Germany and Austria are not at the present moment extraordinarily cordial; and no settlement of the Eastern question is likely to be successful without the previous assent of the most powerful State on the Continent. The Prussian Correspondent of the *Times*, who is apparently sometimes in the secrets of the Cabinet of Berlin, explains the action of Germany by a confused and unmeaning statement about the demand of the German population for additional supplies of provisions. No Austrian treaty would in any way facilitate the importation of Danubian wheat into Prussia. It would appear that, perhaps from regard to the Prussian Prince who reigns in Roumania, the German Government is disposed to promote the independence of the province. The main object of the Russian writer is to insinuate that the measure adopted in concert by the three Courts was a slight to England, and perhaps to France. It seems that the Porte answered their joint demand without consulting the English Ambassador; and Russia naturally exults in one among many proofs that English influence in the East is declining. It would be too much to expect that great Powers should concern themselves with the provisions of treaties. It would have been easy to induce the Roumanian Government to obtain the sanction of the Porte to an arrangement which may perhaps be beneficial. It seems probable that the object of Austria may be rather commercial than political, although there has for some time past been an approximation between Austrian and Russian policy at Constantinople. The permanent interests of States afford a safer guide to their conduct than any special measures which may be suggested by temporary motives. It is possible that Austrian statesmen may favour the practical detachment of Roumania from Turkish sovereignty, but it will never be their policy to countenance an extension of the influence which Russia hopes to establish in the valley of the Danube. If the English Government hereafter persists in its traditional opposition to Russian designs, it may confidently reckon on the co-operation of Austria.

The author of an article in the *Quarterly Review* on Provincial Turkey, who evidently possesses unusual familiarity with Eastern affairs, has the boldness to advocate the policy which was proposed twenty years ago by the Emperor NICHOLAS to the English Government. If the affairs of England were directed absolutely by NAPOLEON or by BISMARCK, it might be possible to try the daring experiment of dividing the Turkish dominions between the two Powers which have long contended for supremacy in the East. The writer proposes that the European provinces should be allowed to fall under the influence or the direct administration of Russia, while Egypt and the countries bordering on the Red Sea and the Persian Gulf should be made dependencies of England. It is a sufficient, if not a satisfactory, answer to the suggestion that no Minister holding power at the will of a Parliamentary majority will ever undertake so vast and perilous a combination. The author of the essay may perhaps have described correctly the decay of Turkish society in consequence of the levelling and centralizing system which was commenced by the father of the present SULTAN. For the local aristocracy of the purely Mahometan provinces modern practice has substituted corrupt agents of the Government, whose function is to amass money for themselves, and to remit a share of their gains to their patrons at Constantinople. It may be true

that a perverse imitation of the worst peculiarities of modern Europe has rendered Turkey incapable of self-defence; but even if it were otherwise possible that England should concert with Russia a scheme of partition, it would be necessary to reckon with Austria, with Germany, and with France. Europe may hereafter acquiesce in the transfer to English administrators of the commercial management for the common good of the Suez Canal; but a claim of sovereignty over Egypt itself would be unanimously resented. The comparatively unambitious policy of protecting the Turkish Empire as long as possible is more practicable, and perhaps it may in itself be more expedient. One strong reason for discouraging and postponing territorial revolutions is to be found in the inevitable progress of sound economical doctrine. A chief motive of the ambition of Russia is the desire to extend the region from which foreign commerce may be excluded. When the same fallacies prevailed in England, successful efforts were made to acquire possessions in all parts of the world. Since the adoption of the principles of Free-trade England has ceased to covet additional colonies; and it is only after long controversy that the petty annexation of the Fiji Islands has been effected by the present Government. When Russia in turn finds that Free-trade is a source of prosperity, the appetite for annexation in Europe and in Asia may perhaps abate. Nations are slow in learning that it is possible to buy and sell to advantage without acquiring the freehold of the shop.

The insolent taunts addressed by Russian journalists to England form an instructive commentary on the project of the new Convention which is to be held at St. Petersburg for the reform of the laws of war. Pure benevolence abhorrent of human suffering finds vent in laws for enlisting and arming the whole population of the Empire, in proposals for facilitating invasion by regular armies, and in unprovoked insults to the only Great Power which has really and ostensibly adopted a policy of peace. On the outskirts of the Russian Empire the population is securing itself by general immigration against the beneficent organization which is to make every man a soldier, and to protect him by the novel laws of war. The Mahometans of the Crimea are escaping into Turkey, while the Russian Government is unable to control its solicitude for the Christian subjects of the SULTAN. The Governments of the Continent yearly increase the intolerable burden of military service; but all of them, with the exception of Russia, may urge in excuse that their armaments may possibly be required for defensive purposes. Both France and Germany contemplate without disguise the renewal at some future time of their struggle, and Austria is from time to time menaced by Russia, and liable to political collisions with Germany. The enormous army of Russia can only be intended for purposes of conquest, which will, it may be presumed, be undertaken and conducted according to the strictest rules of philanthropy as taught at Brussels.

UNIVERSITY EDUCATION AND THE FRENCH ASSEMBLY.

THE French Assembly has shown a commendable knowledge of itself in devoting three days to the discussion of University Education. Careless critics will be disposed to say that in the existing condition of France the first business of a Legislature is to frame a Constitution. But a Chamber which recognizes its political shortcomings may justly plead them as an excuse for shirking a task of this kind; and if once this is admitted, the Assembly could hardly spend its time better than in considering how to train up a generation which shall be better fitted than its predecessor to deal with public affairs. The deputies were well rewarded for their self-denial in thus turning their backs upon politics. Even a debate upon the organization of the Septennate could not well have been more exciting. The Bishop of ORLEANS was unmeasured in his denunciation of the Revolution. M. CHALLEMEL-LACOUR was equally unmeasured in his denunciation of the Church. There was as much in these speeches for the Right and Left to applaud or execrate as if they had been delivered at the very crisis of a constitutional debate. It is not in France alone that a University Bill provokes a disproportionate amount of heat; but in no other country perhaps could the questions really at issue have been so systematically ignored. In the German Parliament there would probably have been even greater excitement about the religious side of the controversy; but the fact that it

has an educational side as well would have been remembered from time to time.

The issue of the discussion was at no time doubtful; but if it had been possible for injudicious oratory to frustrate the speaker's object, neither the Bishop of ORLEANS nor M. CHALLEMEL-LACOUR would have much cause for self-congratulation. The debate was opened by M. BERT, who, in opposing that freedom of the higher education which the Bishop of ORLEANS demands, said so many damaging things about the present system that it only wanted a little management to make his speech appear as an argument on the BISHOP'S side. To whatever cause the failure is to be set down, it seems clear that in many respects the system of having a single University for the whole of France, under the supervision and control of the Government, has worked ill for the interests of education. The Faculties have been starved, and originality of teaching has been steadily discouraged. M. BERT would remedy these defects by the creation of four Universities, supported, if we understand him rightly, by grants from the State and from the towns in which they are situated, and by the fees paid by the students. These Universities would be independent of the Government and independent of the University of France, which would then become once more the University of Paris. This is not a scheme at all calculated to please the Bishop of ORLEANS, but he need not have denounced one plan for abolishing the monopoly now enjoyed by the University of France while in the act of advocating another plan for attaining the same end. M. BERT'S proposal was not properly before the Assembly, and until it is he might have been set down as a fellow-labourer rather than as an adversary. But the Bishop of ORLEANS had heard liberty of teaching interpreted to mean, not liberty to any one to teach, but liberty to teach anything, and the very sound of the words was enough. He could not even control himself so far as to hold M. BERT'S plan up to the laughter of the Assembly, a task which a less able speaker than the BISHOP might have achieved without difficulty. M. BERT'S ideal of educational freedom has been best attained, it seems, at Berlin, where some years since a complete system of doctrine was maintained by a certain Professor on one day and disproved from the same chair by his assistant on another day. All opinions, however absurd, are to find a place in M. BERT'S Universities, and he would leave it to the students to show by their absence from the Professor's lectures the low esteem in which they hold his views. It was hardly necessary for the Bishop of ORLEANS to repudiate this theory of liberty, and a little more self-restraint would have saved him from the inconsistency of denouncing freedom of teaching as applied to other people, while claiming it as applied to himself. Nor was it prudent to make a debate on University education the occasion for an attack upon the Revolution. He might have extolled the age when three-and-twenty independent Universities secured freedom of education, and met the intellectual needs of the French people, without tracing the extinction of letters to those principles of 1789 which have had so many and such contradictory accusations laid at their door.

Any errors on the part of the BISHOP were soon forgotten in the excitement caused by M. CHALLEMEL-LACOUR'S reply. The two deputies look at the question in the same light. Both see in freedom to found Universities an opportunity of which the Church is sure to avail herself. When M. CHALLEMEL-LACOUR comes to talk about the Church, he is quite as outspoken in his language as the Bishop of ORLEANS is when he talks about the Revolution. If there were no GALLIES interposed between them, these enraged champions would not rest until they had sent one or the other to the stake or the guillotine. The value of liberty, according to M. CHALLEMEL-LACOUR, depends entirely upon the use that is to be made of it; and the use that is to be made of it will be determined by the character of the persons who enjoy it. The only persons who will profit by liberty to found new Universities will be the Catholic clergy. They have the gift of teaching in an eminent degree, and they will make excellent professors. But the lawyers, the doctors, the men of science brought up under their teaching will be all devoted to the Syllabus, and pledged to destroy the whole fabric of modern society because the Syllabus has cursed it. A system which is attacked has a right to defend itself, and to give the clergy permission to found Universities would be to put arms into the enemy's hand.

M. LABOULAYE defended the Bill on the wider ground that he was not prepared to refuse to others the liberty which he claimed for himself. If the Bishop of ORLEANS did not shut his eyes to the progress of events he would see that on this ground alone it is possible for the Church to obtain that fair field which, as he complains, is denied to her by the present uniformity in the higher education. If the Roman Catholic clergy had sufficient faith in their own principles to let them take their chance with others in the arena, they would find a certain number of Liberals who would be willing to admit them as competitors on equal terms. So long as they go on protesting that, though they claim admission to the lists as a matter of right for themselves, they intend to close them against all other combatants as soon as they get the strength to do so, a Liberal need have very robust faith in his own principles to be willing to pull down any barriers to their progress which he may find existing. Now a robust faith in their own principles is a quality which French Liberals rarely possess. They are more inclined to suppress their opponents than to disregard them. The frequent examples of men brought up in the strictest sect of Ultramontanism, becoming free-thinkers even in the Seminary itself have not shaken M. CHALLEMEL-LACOUR'S belief that the clergy only want opportunity to make all their pupils think as they do. In his heart he suspects that modern ideas only prevail over mediæval ideas because they happen to have force on their side, and this force can be used to prevent mediæval ideas from gaining the influence over mankind which they would otherwise have. In this respect there is wonderfully little difference between him and M. DUPANLOUP. Each so far follows the apostolic maxim that he esteems the other to be better, in the sense of stronger, than himself, and each is resolved not to be squeamish about taking unfair advantages.

Looking at the question as Englishmen, we have great reason to be satisfied that our University system, whatever may be its shortcomings in other respects, is neither governmental nor clerical. Oxford and Cambridge have failings of their own in abundance, but there is nothing in their system to stereotype these failings for the future. They represent only too sensitively the intellectual phase of the hour, but they do not protect it against attack from without or revolt from within. The antagonism which, it is to be feared, will arise between the new clerical Universities, if any such are founded in France, and the State University, is reproduced among us by the antagonism between rival schools of thought in the Universities themselves. But for the unwise prohibition which prevents Roman Catholics from going to Oxford or Cambridge, the representation of this antagonism would have been more complete than it is. The difficulties in the way of a thoroughly satisfactory settlement of the question of University education will not be appreciated in France until the details of the Bill come to be discussed.

AGRICULTURAL POLITICS.

THE Central Chamber of Agriculture represents, according to its Report, fifty-four local associations, and both the constituent bodies and the federal Council devote themselves with praiseworthy concentration of purpose to the promotion of the interests of tenant-farmers. A few landowners, including Lord HAMPTON and Sir GEORGE JENKINSON, serve as ornamental appendages to the Chamber, but it may be doubted whether the most liberal landlord heartily sympathizes with efforts to rearrange contracts relating to land for the exclusive benefit of the occupiers. The spirit in which the Chamber conducts its operations is clearly displayed in several passages of the Report, as in the expression of regret that a larger number of tenant-farmers was not returned to Parliament for counties at the general election. There is nothing to prevent farmers from electing, if they think fit, representatives from among themselves; but in this, as in other cases, political power is a constant quantity, and whatever is given to one section of the community must be taken from another. The substitution of farmers for the landed gentry in the House of Commons would be almost a political and social revolution; and the change would not be regarded with satisfaction by those who are anxious to preserve as long as possible what remains of the aristocratic element in the English Constitution. The local self-government of which Englishmen boast, and which foreigners

admire, has from the earliest times been in rural districts administered by the landed gentry. Except in matters affecting their own pockets the farmers would be at least as Conservative as the landowners, and they would offer a more resolute opposition than the present county members to the further dilution of the suffrage; but the influence of rank and property forms the main distinction between the English Constitution and the numerous Continental experiments in representative government. As a sagacious Liberal of the last generation who lived much in France often said, "How is a department to be independent of the Prefect when there is not a single resident to whom any-body else will touch his hat?" The Ballot will enable the farmers at their pleasure to displace the landlords who have hitherto been their Parliamentary representatives and political leaders. It would seem from the Report of the Council of the Chamber of Agriculture that the more active members of the association consider the innovation desirable. As the Council and the Chamber confine their attention exclusively to agricultural interests, they have perhaps not considered the importance of the political results which would follow from the selection of county members from a new class.

The Council in their Report disclaim the demand which had been preferred by some of their members for the creation of a separate department with a Minister for Agriculture at its head. There is no objection to the moderate proposal that the distribution of legislative and administrative business relating to agriculture should, if necessary, be rearranged. The whole amount is insignificant, for measures affecting the relations between landlord and tenant would require the intervention of some principal Minister, and would be discussed in Parliament as important political questions. The application of the Acts for preventing the spread of contagious diseases of animals might possibly be more conveniently managed by the Board of Trade than by the Privy Council. The Chamber naturally looks at the subject from the point of view of owners and breeders of stock, who are interested in the maintenance of sufficient securities against infection. Many farmers and graziers suffered almost ruinous losses from the cattle plague seven or eight years ago, and since that time the foot and mouth disease has occasionally done great injury in almost all parts of the country. It is perfectly proper that the farmers should insist on adequate precautions; but it is necessary to guard against the operation of motives of which perhaps they are not distinctly conscious. Every restriction on the importation of foreign cattle incidentally protects native produce. English farmers have a perfect right to protest against the introduction of disease among their own herds; but the consumer has a strong interest in securing the modest competition of foreign cattle with the natural monopoly of the home breeder and feeder. A strong feeling seems to be entertained against the veterinary advisers of the Privy Council, who may perhaps have inclined to a lax judgment on measures of prohibition. The proper authorities will pay due attention to the representatives of the agricultural interest, but it may be hoped that they will not yield to any one-sided or unfounded clamour. If any change or consolidation is effected in official arrangements, it will probably be found that the Board of Trade, even if it is called the Board of Trade and Agriculture, will adopt the practice of the Privy Council. Sir G. JENKINSON, who doubted the expediency of the proposed alteration, assumed that the chief of the new Department would be selected from the ranks of the professed farmers' friends. It would be highly undesirable to entrust any branch of public business to a representative of the special interests which it may be his duty to control as well as to protect.

The harmony of the meeting in discussing the question of local taxation was only disturbed by the scepticism of Mr. CORRANCE, who questioned the excellence of the last Budget. Two millions were, as he truly said, thrown away by the reduction of a penny in the percentage of Income-tax; and Mr. CORRANCE feared that contribution from the Imperial revenue in aid of the rates would interfere with efficient local administration. Although it may be doubted whether the pledges which were partially redeemed by Sir S. NORTHGOTE's donation were consistent with sound policy, the mode in which he offered relief to ratepayers was highly judicious. The payment of a part of the cost of pauper lunatics will not tend to promote insanity; and in undertaking an additional share of the burden of the police, the Government, intentionally or otherwise, pre-

pares the way for a central administration of the force, which would produce great public advantage. The whole police of the kingdom ought to be subject to the same superior control, and its functions ought not to be limited by the boundaries of counties and boroughs. If at any future time the whole cost of the police is imposed on the taxpayer, the Government will certainly demand exclusive power corresponding to the national liability. The expressions of gratitude to the present Government for its concessions were prudently moderate and judiciously prospective. As one of the speakers remarked, the Government had done all that it could; and perhaps hereafter, when a new surplus accrues, the land may get an additional bonus. For the same reason the Chamber expressed conventional regret that no attempt had been made to deal with the Malt-tax. It is well understood that no Chancellor of the Exchequer is likely to sacrifice a revenue of six millions from a tax of which the consumers who pay it scarcely complain. The House of Commons has no compassion for brewers, and it probably thinks that enough has for the present been done for sellers and buyers of beer. The malt-growers are themselves only a minority among the farmers, and fiscal legislation has of late years been seldom altered for the benefit of producers. On the whole, Mr. DISRAELI and his colleagues may probably rely on the good will, if not on the active support, of the Chamber of Agriculture. If they neglect the duty of repealing the Malt-tax, there is no reason to suppose that any probable successors would be more compliant.

The question of the claims of tenants on landlords excited more interest than the discussion of rates or of Malt-tax. The plausible demand of compensation for unexhausted improvements is gradually giving way to the ominous phrase of tenant-right. There is no dispute as to the justice of allowing to an outgoing tenant the value of crops, of unexhausted manures, or of other additions to the fertility and value of the land. In draining and other permanent improvements the owner ought to have a voice; and in many parts of the country no expenditure of the kind is ever incurred by the tenant. Mr. HOWARD and other advocates of the interests of tenant-farmers greatly exaggerate the effect which legislation might have in attracting capital to the land. There are large parts of the country in which tenants never think of making improvements; and yet under a general law they would on leaving their farms invariably claim compensation, and support their demand by the evidence of sympathetic neighbours. In more advanced districts the Lincolnshire custom, or some similar rule of compensation, might be advantageously introduced; but the demand for tenant-right points to the precedent of the Irish Act and to compensation for disturbance. It is commonly asserted that Mr. GLADSTONE's measure transferred seventy millions sterling from the landlord to the tenant; and it is not worth while to inquire whether the interference with property was justified by preponderating considerations of public good. English tenants have no moral or equitable claim to a share in the ownership of the land, nor is it desirable that incoming tenants should be habitually required to purchase, according to the Ulster custom, another property besides that which they take from the owner. A writer on the subject lately proposed that farms should be valued on entering and on quitting, and that any excess or deficiency should be respectively paid for by the landlord or by the tenant. It is intolerable that property should depend on incessant and compulsory valuations; and the landlord would often have to deal with an insolvent tenant. A stronger objection to the scheme is that it would transfer Mr. MILL's unearned increment, not to the State, but to the tenant. It is natural that a majority of tenant-farmers in the Chambers of Agriculture should decide every theoretical question against the landowner.

PARTIES IN FRANCE.

THE expectation that the meeting of the French Assembly would be the signal for another, if an indecisive, conflict of parties has not been fulfilled. The deputies have come back from visiting their constituents, and are to all appearance as much in the dark about their wishes and the best means of giving effect to them as at the beginning of the recess. Marshal MACMAHON has spoken out plainly, but the world has got accustomed by this time to see nothing come of his plain speaking. He

has asked once more for constitutional laws, and described the unhappy state of a Government which cannot find a contractor to provide it with the powers necessary to its existence. In the meantime, however, the Government lives and moves and does pretty much what it likes, so that there is some excuse for the neglect with which its lamentations have been treated. One little operation the Assembly has effected; and in a country which has lately sustained such tremendous material losses, perhaps this is as great a service as a Legislature can be expected to do. It has sent up the Funds. But the means by which this success has been won are hardly complimentary to its authors. There is greater confidence in the money market because the Assembly is going to adjourn for three weeks. The best wishes that a constitutional patriot can frame for the representatives of the people is that they should take a holiday nineteen days after they have begun work for the year. This is not only a true description of what the state of affairs is now; it is also, for anything that can be foreseen to the contrary, a true description of what the state of affairs is likely to remain. They can only be legally altered in one of two ways. Either the Assembly must frame a Constitution of some kind, or it must consent to dissolve itself. The difficulties in the way of the first solution become greater instead of less. The organization of the Septennate, in a provisional sense, has been rendered impossible by the defection of the Extreme Right. Provisional Governments can only be organized when a majority of all parties wish to postpone the organization of anything definitive. But this is not the case in the French Assembly. There is a party which wishes to have the Republic proclaimed at once, and a party which wishes to have the Count of CHAMBORED restored at once, and these two together are more than strong enough to defeat the party which wishes to have nothing final done at once. The partial elections held during the recess have apparently not strengthened the Republican party as much as they were expected to do. Nearly all the members returned were Republicans, but this reinforcement has probably gone to balance secret defections rather than to raise the aggregate vote to a higher total. The willingness of the Extreme Left to see the Republic organized by the present Chamber is likely to decrease as the Conservative tendencies of those who would have to organize it become more pronounced; so that, even if the long talked of conjunction of the Centres were to become a reality, it is doubtful whether the Left Centre would not lose as many votes in one direction as they would gain in another. Unless, therefore, Marshal MACMAHON should prove to have an amount of influence over the Assembly of which there is no present evidence, the Constitutional Laws are likely either to remain in the limbo of the Committee of Thirty or to be brought thence only to be annihilated. It is to the MARSHAL's credit that the deputies should place so much trust in his indestructible reverence for Parliamentary incompetence. But at times it is difficult not to wish that they were in the hands of a ruler who would insist on their knowing their own minds.

The second alternative is no more likely to be adopted than the first. If the Government were to throw its weight on the side of dissolution, it is possible that it might secure a majority. But the Government has no higher ambition than to organize the Septennate, and it is clear that this is the thing of all others which a new Assembly would not do. If Marshal MACMAHON wishes to retain power till 1880, whether the Legislature wishes it or not, he had obviously better keep the Assembly he has, rather than change it for one of which he knows nothing. The existing Chamber is at all events inactive, and, as the relations between it and the constituencies are purely accidental, there is no fear of its being urged from without to do something which the MARSHAL would rather it left undone. A new Assembly would feel bound to do something, if only out of respect for the electors who had sent it to Versailles for that very purpose. If the powers about which the MARSHAL talks in his Messages were really essential to his happiness, he might be inclined to run any risks rather than forego them. But they are nothing of the kind. The Government, like all French Governments while they last, is absolute, and what can any Government wish more? Apparently Marshal MACMAHON is nice in his absolutism, and would like to suppress newspapers by a regular Press law rather than by virtue of the state of siege. But the newspapers get suppressed either way; and it might be making personal

government too much of a luxury to give it the machinery of constitutional government in addition to its own.

If the MARSHAL is not likely to suggest a dissolution to the Assembly, is the Assembly likely to suggest a dissolution to itself? So far as can be calculated from the known or suspected wishes of the various parties in the Chamber, it seems safe to say that a majority in favour of such a plan is most unlikely to be got together. It is true that during the last Session the Left Centre seemed to have brought themselves to the point of facing their constituents; but at that time they had not been disabused of the notion that France is Left Centre. They thought that a genuine election would result in the return of a majority of moderate Republicans, and they had consequently no dislike to a dissolution except such as might be suggested to individual deputies by a fear for their own seats. Many of them might doubt whether they themselves would be returned again; but they had no reason to doubt that the deputies actually returned would be men of like passions with themselves. They can hardly retain this confidence now. It rested on the belief that the Radicals had learned wisdom by adversity, and had consented to suppress their own claims in favour of the claims of moderate Republicans. Six months ago this belief seemed to have some solid foundation; but the Left Centre forgot that even a depressed Radical requires some consideration money before he will consent to efface himself *simpliciter*. In this case the consideration money was the immediate establishment of the Republic, and if the Left Centre had been able to accomplish this, it is probable that the Radicals would have held to their bargain. But the Left Centre had over-rated their own powers. They had promised more than they could perform, and the recent municipal elections expressed the discontent of the Radicals at discovering this. They had allowed the Left Centre to act as though there were no other Republicanism but Conservative Republicanism because they thought that even Conservative Republicanism was better than none at all. Now it turns out that Conservative Republicanism is the same thing as none at all, and they not very unnaturally feel that they have given their submission for nothing. But it is not given past recall. The Radicals have nothing to do but to separate themselves from the Moderates, and they can secure the return of their own candidate in every Republican constituency, and the defeat of the Left Centre candidate in every Conservative constituency. The Left Centre know this quite as well as the Radicals, and under these circumstances they can have nothing to hope from a dissolution. Yet they are the only party which can make a dissolution possible, since the Right know that no Assembly will do more for them than the present, while the Left, who would like to go to the country, are powerless to get there without the help of the Left Centre. There is a possibility that the consciousness of their weakness in this respect may induce them to make fresh overtures to the Conservative Republicans, but except by this means the life of the Assembly seems to run no immediate risk of being cut short.

THE NAVY.

THE speech of Mr. E. J. REED at Pembroke Dock on the Navy deserves attention. He complains forcibly that, in comparison with the wealth of this country and the necessities of its condition, only a small sum is to be spent upon new ironclads during the current year. He views the proposal to spend only 660,000*l.* as a practical abandonment of the position of this country in Europe. He quoted with approval a recent speech of Lord HENRY LENNOX, who declared that the time had arrived when the Government should regulate the expenditure of the nation by its requirements and necessities, and by no other principle. Hitherto, said Mr. REED, an opposite principle had prevailed, and the requirements of the service had to yield to political exigency. He thinks that the policy which he advocates, by giving permanence to our proceedings, and by providing for a steady addition to our naval forces, would practically tend in the long run to diminish expenditure. He did not concur with those members of his own party who objected to Mr. WARD HUNT's speech on the Navy Estimates. He accepts that speech as a pledge to do that which the speaker admitted to be necessary. The Minister described the fleet of this country as comprising only 41 sea-going ironclads, of which 5 were building, 9 were either obsolete or not worth repairing, 9 were not condemned, but

could not be considered effective for the service of the year, 4 were under repair, and only 14 of the whole 41 were then serviceable and effective. Here, says Mr. REED, is a pledge on the part of the FIRST LORD to bring no fewer than 27 ironclads promptly into the condition of real and effective ships, and great would be the advantage to the country if this promise were to be promptly fulfilled. He complains strongly of the Admiralty for withdrawing from its purpose of sending the *Devastation* at once to Gibraltar. "But unfortunately, just as unreasonable confidence prevailed when the *Captain* was sent to sea, unreasonable distrust has prevailed now, and the country and the naval service must suffer in consequence." At the same time Mr. REED does not advocate the continually sending to sea of exceptional vessels which were, in point of fact, built only for occasional voyages. But he thinks it incumbent on the Administration to determine all those questions which the trial of the *Devastation* on a voyage to Gibraltar would probably settle, and settle without danger. The voyage of the *Devastation* has however been postponed; but if the delay of her trial is made a pretext for suspending the construction of similar ships, we think that the country will have reason to complain. There can, at any rate, be no doubt that such ships are excellently adapted for coast defence. We must provide, even if need be at heavy cost, for the present, and we cannot venture to put off shipbuilding until that indefinite future which shall produce a design for a man-of-war which all critics will confess to be perfect. We can only do the best that is possible under the circumstances, and it cannot be doubted that half a dozen ships like the *Devastation* would be a great security against invasion.

When complaint is made of the insufficiency of the army, the usual answer is that we must depend upon the navy; but, unless Mr. REED is entirely mistaken, the navy is not prepared to supplement the shortcomings of the sister service in case of sudden war. Even if we had spent much more money on shipbuilding than we have spent, we should not have attained anything like the security which we formerly enjoyed, because we should not have anything like the reserve of ships which we used to keep. It is considerably under twenty years since the first of our ironclads was constructed, and already we are told that nine of them are obsolete or not worth repairing. It may be admitted that other naval Powers are short of reserves from the same cause; but no other Power depends as we do for safety on its fleet. We are not only liable, more or less, to invasion, but we draw our food supplies largely from abroad, and any serious interruption of our foreign trade would be starvation. We used to be prepared to fight anybody anywhere at sea. We were often hardly pressed for seamen, but ships were never wanting, because we had accumulated in course of years a stock, of which the whole was serviceable, although the older ships had been improved upon, and usually by the study of models taken from our enemies. In the year 1805 the country put forth to the utmost its resources to resist the threatened invasion of NAPOLEON, and we find that 21 line-of-battle ships were commissioned during that year, so that the total of such ships in commission amounted by the end of the year to 104. The magnitude of this armament may be estimated by observing that NELSON fought the battle of Trafalgar with 27 ships, which formed a fleet more than equal, as the event proved, to the largest fleet which NAPOLEON was able to collect under one command against it. After putting in commission 104 ships, there were still 16 ships in ordinary for sea service, and there were 26 ships building. It must be allowed that a year before, when there were 33 ships in ordinary, as many as 22 were reported to be in want of thorough repair, and it was only by adopting a new system of "doubling and bracing" that these ships were made fit for sea. But still they went to sea and fought battles, and several of them remained at sea for six or seven years. We are told that the efforts made in 1805 were gigantic; but if we were in similar peril now, our efforts to meet it would need to be superhuman. It may almost be said that the whole of our fleet which existed twenty years ago has been wiped out, and we have failed to create a new fleet, either because we really were in doubt what kind of ships to build, or because it was convenient to Ministers to pretend to be in doubt in order to escape financial trouble. It is even more difficult to extemporize a fleet than an army. We may perhaps persuade ourselves, in spite of warnings to the contrary, that raw levies would

fight well on their own soil; but the wildest imagination could not conceive that sailors can be useful without ships. Even in 1805 it was understood to be hopeless to hurry shipbuilders, and it has become utterly impossible now that a ship of war is a much more elaborate and artificial structure. Even if we suppose that there is a tendency to rely rather on guns than armour in the future, we have to provide for the present, in which armour is for line-of-battle ships confessedly necessary. A useful discussion has lately been raised by Mr. REED as to the armament of unarmoured ships. He insists that some of these ships ought to carry armour-piercing guns, and he seems to contemplate the possibility of such ships successfully engaging ironclads. But this is mere supposition, and even if it were well founded, the difficulty would only be shifted, as it is not probable that we have enough armour-piercing guns to equip all the unarmoured ships we could send to sea. In fact, guns as well as ships have become obsolete, whereas formerly our serviceable stock of both had accumulated during many years.

One feature of our present prospect is not wholly unsatisfactory. Mr. REED rather oddly states, as the result of his calculations, that where formerly we had to invest 100*l.* we must now invest 170*l.*, in order to carry the same number of men to sea. He seems to suppose himself to be contending against somebody who insists that the safety of the country requires that a fixed number of seamen should be maintained without reference to the number and size of the ships composing our fleet. But it would probably be admitted by all rational disputants that the tendency of modern improvements is to increase the fighting power of ships without imposing a necessity to increase the numbers of their crews, but rather the other way. It was always held in the British navy that discipline was more valuable than numbers, and in all the victories of NELSON and his contemporaries our ships carried fewer men than were opposed to them. Still it must be remembered that all recent improvements in ships and guns require increased skill in those who are to use them, and we cannot, as we used to do, take sailors out of a merchantman and expect them to do the work of a man-of-war. It would seem, therefore, that Mr. REED ought to demand more ships and not fewer seamen. Whether it costs 100*l.* or 170*l.* to keep a given number of men afloat is immaterial. The practical question is, What number of men is required afloat for the safety and honour of the country? and this can only be answered by determining to maintain some proportion between our own force and the forces which may possibly be combined against us. If Mr. REED, however, should propose in Parliament to reduce the number of seamen for next year in order to apply the money thus saved to building ships, he may perhaps provoke the remark that there is nothing like leather in the opinion of those who deal in it. It will be difficult to persuade the public that we have too many sailors, especially when it is confessed that we have sadly too few soldiers. In the present alarming dearth of fighting men, it would be the height of folly to part with any that we have got, particularly as it has been seen in the Ashantee campaign that our sailors are fully capable of marching and fighting upon land.

Hearty sympathy will be felt with Mr. REED's desire to bring about a better relationship and closer identity between the Mercantile Marine and the Royal Navy, and if the services of seamen generally can be made available in time of war, it will become necessary to provide a sufficiency of cruising and fighting ships in which they may be employed. The recent awful losses of ships through structural weakness, to which Mr. REED referred, are at least useful in showing that the ancient spirit of our navy is not extinct. The conduct of the Captain of *La Plata* was worthy of its most glorious days, and it is some consolation under recent disasters to remember that a south-west gale has been often a potent ally of England. The best seamen have least to fear from storms, and it avails not to build ironclad ships and arm them with heavy guns unless there be also skill to manage them. As long as our sailors have this skill, we possess a reserve independent of parsimonious administrators. But, looking to the accumulation of our wealth and the development of our trade, we should be mad to neglect any measure which experience suggests for their security. If Mr. WARD HUNT will perform his duty in the spirit in which he entered on it, he will not want support. But it will be idle for any Minister to pretend that the condition of the navy is satisfactory. The figures

which Mr. REED quotes are so simple that the conclusion from them is inevitable. Without determining how strong our ironclad fleet ought to be, we may act on the assumption that it is now dangerously weak.

THE DRAMATIC CENSORSHIP.

THE action for libel against *Vanity Fair* supplies an appropriate and instructive commentary on the remarks which we had last week to make on the impropriety of the performances at certain theatres. There can be no doubt that the dance which was impugned was indecent, and even grossly indecent, but the plaintiff had no difficulty in finding persons who were willing to testify that they had seen it, enjoyed it, and had not been in the least shocked by it. Indeed some of them had even taken their wives. One witness said he took his wife, and she saw no harm in the dance. Another said his wife liked it so much that she went to see it a second time. A third said he had gone to the theatre with what he called "ladies," and they were not at all put out by anything they saw. There is no reason to doubt the honesty of this evidence, but it seems to us to point to a different conclusion from that for which it was adduced. We will say nothing about the men, but that any woman with the faintest sense of the most elementary decency could possibly sit out publicly, and more than once, such a spectacle of the degradation of her sex, is surely a melancholy proof of the debasing influence of such exhibitions. It is obvious indeed that, if this sort of thing is permitted at all, it must inevitably tend so to vitiate and deprave the public taste that by and by, by mere force of habit and familiarity, people will cease to be shocked at anything. It cannot be denied that popular notions of modesty are of a somewhat conventional character, and vary greatly in different parts of the world. There is, however, a tolerably settled and distinct conviction in this country as to the extent to which self-exposure in public should be tolerated; and though there might be a difficulty in laying down very precise rules as to the manner in which the subject should be regulated, there can be no difficulty whatever in enforcing such a general standard of decency on the stage as shall prevent a recurrence of the scandals of which complaint has justly been made. We recollect reading in an old book of etiquette that, if a lady was in doubt as to whether a ribbon was dirty, she might be sure from the mere fact of the doubt that she ought not to wear it. This, it seems to us, should be the rule of the stage. There should be no room for doubt as to whether a play is or is not decent. If there is really a doubt, the piece should be suppressed. In saying this, we are referring of course, not to subtle questions of what may be called intellectual morality, but to gross and open physical allurements.

THE LORD CHAMBERLAIN may perhaps have been misreported, but he seems to have said that he saw the dance at the theatre in question, that he thought it purposely and offensively indecent, and that his own opinion was that the theatre should have been at once deprived of its licence; but that, yielding to advice, he did not carry out this intention. We do not of course know the grounds of this advice, or from whom it came. But it seems to us very bad advice. This was a very disgraceful case of the sort of misconduct which it is the LORD CHAMBERLAIN'S business to put down, and it is greatly to be regretted that he neglected to take the opportunity of making an example which would have had an extremely salutary effect. He ought instantly to have cancelled the licence, and there can be no doubt that, if he had done so, he would have been warmly and gratefully supported by public opinion. It is to be hoped that this prompt and peremptory course will be followed on the occasion of the next offence of a similar kind. It is necessary to remember the peculiar position which theatres occupy. The right to open a theatre is not the common right of everybody. It is a special privilege and monopoly, which is granted only on certain conditions, and one of these conditions—at least in London—is that the pieces produced shall be subject to the supervision and authority of the Lord Chamberlain. Nobody need keep a theatre unless he likes, but, if he does, he must submit to these conditions; and the abuses which have crept in would not have reached such a climax of effrontery if the Lord Chamberlain—we are speaking of course of successive occupants of the office—had been more uniformly firm and stringent. There are only a comparatively small number of persons who enjoy

or covet the right to open a theatre in London, and there can be no difficulty in ascertaining all about their private characters and antecedents; and no licence should be granted except to a person of unquestionable respectability. If the theatre is sub-let in any way, of course the licensee will be personally responsible for the behaviour of his deputy. The Lord Chamberlain has thus in his hands an irresistible authority, and it is much to be wished that he would exercise it. It is monstrous that any person should be allowed to use a special privilege, which is supposed to be for the public benefit, in order to do the public harm. On a first offence a warning might be given; but defiance should be promptly punished by a withdrawal of the licence. If one or two houses were shut up in this way, it would bring managers to their senses. There is, we are aware, a difficulty about theatres which are beyond the Lord Chamberlain's limited jurisdiction, and this is a question which deserves serious consideration. In any case, however, it is necessary that such powers of regulation as exist should be vigorously employed.

It may perhaps be said that theatres which indulge in immodest freaks must soon acquire a reputation which will be a warning to decent people to keep away from them. But this is a plea which cannot for a moment be allowed. The public has a right to the theatres, and to all the theatres, and they ought to be conducted in such a way that respectable persons should not be afraid to go to them, or to take their wives and children. In such a case there is a common standard of decorum which everybody understands. We have already remarked on the influence which the theatre exercises, not merely on those who frequent it, but on society at large. It is impossible that any reservoirs of pollution can be allowed to be set apart for the special service of the depraved voluptuaries or silly lads who may choose to go to them. It is necessary to take into account the interest of the stage itself, as an honourable and useful profession. We observe that one of the theatres has put forth a special appeal to the gentlemen from the country who come up for the Cattle Show. They are invited to regale themselves in the evening with an exhibition very similar in character to that which has engaged their attention during the day. "VENUS, the goddess of material love," is offered for inspection, and our country friends will have an opportunity of enjoying the unreserved exposure of her "points" and those of her companions. It is obvious that, if this sort of show is to become common, the eloquent and picturesque writer who does the Smithfield Show for the *Times*, and who describes so graphically the "beast of ample size, level form, but somewhat weak in rib and rump," and "the perfect beauty, with superb bosom, neck, shoulders, and flank," may be expected to turn his attention to dramatic criticism. It is sometimes remarked at Islington that an animal "reveals to the hand a want of solidity not at once discerned by the eye"; but it is to be hoped that country visitors will be made to understand that at the theatre—as yet—their curiosity cannot be indulged to quite the same extent. It is evident that performances of this kind must necessarily degrade the stage and tend to keep away from it those who might do much for its elevation, and for the higher culture as well as amusement of the people. To-day Miss HELEN FAUCIT reappears for a special occasion; but where are her successors? The most conspicuous and deplorable weakness of the theatres at the present day is the want of actresses capable of portraying a high class of characters. There are happily still one or two left, but the supply is obviously failing, and it is impossible to wonder that it should fail when we see the sort of professional companionship to which women who embrace the profession are exposed. The essential condition of a pure, lofty, and wholesome drama is that the stage should be cleared of its "material goddesses."

THE TRANSIT OF VENUS.

THE great event which has been the one subject of conversation in astronomical circles for the last two years is at last over, and we are daily receiving fresh news of the success with which the practised observers who, in stations dotted here and there over more than half the surface of the globe, watched the transit of Venus, have utilized the precious minutes that were allowed them. The interest felt in the event has been universal. The desire to know the scale on which the universe is built will hardly

seem a culpable or idle curiosity even in the eyes of the most cynical of practical men, and nothing less than the discovery of this is the expected result and the acknowledged aim of astronomers in this case. No doubt the world of the dinner-table, which finds itself bored with having to talk about the rival merits of the Halleyan and Delisleian methods, will be relieved when the interest in the matter is removed by the final settlement of the question, and when it is allowed to betake itself again to some more congenial topic than one which requires at least a knowledge of astronomical terms; nor will it derive any permanent satisfaction from the consciousness that we have shaken ourselves finally free from an error which magnified the linear dimensions of the universe by one-thirtieth. But it will be long before thoughtful men forget an event which at once illustrates how vast are the dimensions of the solar system and other celestial distances compared with any terrestrial magnitudes, and in so doing gives a striking instance of the complete victory of human intelligence over the difficulties thus thrown in the way of its pursuit of knowledge.

The acknowledged object of the observations of the transit of Venus is to enable us to calculate the distance of the sun from the earth. Were the earth so small that it might be regarded as a mere point in comparison with celestial spaces, it is easy to see that no observation of a heavenly body could tell us more than its direction and angular magnitude when viewed from the earth; of its distance and actual magnitude we should alike be totally ignorant. If, on the contrary, the earth were so vast and the distances of heavenly bodies from it so small that, when viewed from different parts, they appeared in very different parts of the heavens (i.e. in very different positions relative to the fixed stars), it is equally clear that two observations of the position of the same celestial body made at the same moment from two different parts of the earth at a known distance from one another, would give us its actual distance from each; for it would be an instance of the well-known surveyor's method of determining the distance of an inaccessible object by measuring a base line, and observing the position of the object from each end of the line. The actual case of the earth is intermediate between these two cases. With a body so near to us as the moon, a difference in position in the observers upon the earth produces a distinct difference in position of the moon, as is shown by the well-known fact that in a solar eclipse the moon may appear to cover the sun from one station, while it covers only a small portion of it when viewed from another. But if the sun could at one and the same moment be viewed from two diametrically opposite points on the earth's surface, it would scarcely seem to be displaced among the stars through a distance equal to one-hundredth part of the breadth of its own disc. Now, admirable as our astronomical instruments are, this in itself is but a small quantity to observe, and to obtain it correctly to about one-thirtieth of itself would baffle utterly the most refined observations; greater errors than these must continually be present in our best observations, from defects and changes in the instruments and observers, even if the atmospheric conditions did not forbid us to attempt the direct determination of such minute quantities. Thus, unless we can get some phenomenon in which this effect of the actual magnitude of the earth in producing displacement in the heavenly bodies when viewed from different parts of it is magnified, we must rest content with a very rough idea of what that effect is, and consequently of what are the actual celestial distances.

But here Kepler's great discoveries come to our aid. They enable us to calculate the relative distances of the planets from the sun without any knowledge of the actual distances, by ascertaining the length of time that each planet requires to make a complete revolution round the sun. From this we learn that the distance of Mars from the sun is about one-half as great again as that of the earth, while the distance of Venus is about three-fourths of our distance. Hence, when Mars is nearest to us, it is only half as far from us as the sun is, and when Venus is at its nearest it is one-fourth as far; so that the effects of our terrestrial distances will be doubled in the one case and magnified fourfold in the other, and our chances of getting accurate results are proportionally increased. But there is a striking difference between the two cases. Venus is nearest to us when it is directly between us and the sun, but the orbit of Mars encloses ours, and thus that planet is nearest to us when we are directly between it and the sun, and it appears to be at a point of the heavens diametrically opposite to the sun. Hence, when in these positions, Mars can be observed all night long, while Venus, when in the corresponding position, cannot be observed at all, as it is buried in the rays of the sun. This very peculiarity, which renders such direct observation of Venus so difficult and useless for our present purpose, causes it to give us on certain occasions an invaluable method of determining the celestial distances. Though Venus generally passes a little above or a little below the sun, yet upon rare occasions it passes actually between the earth and the sun, and is seen projected on the sun's disc. The unparalleled advantages of such an opportunity for measuring the exact effect of terrestrial distances in producing apparent displacement in celestial objects is obvious on a moment's thought. Not only have we a small and perfectly defined disc on which to mark the apparent position of the planet, but we have the far greater advantage that to some observers Venus will seem to pass nearer the centre of the sun than to others, and consequently will have a longer path on the sun's face, and will therefore take longer to cross. Moreover, to some it will begin to cross at an earlier moment than will be the case with others. Now time can

be observed with the most complete accuracy, and thus an effect of displacement which can be made a question of a time-observation is vastly to be preferred to any other. Such are the chief advantages which a transit of Venus possesses. The methods of utilizing one are greatly modified by the fact that allowance must be made for the rotation and motion of the earth during the not inconsiderable time occupied by the transit. But in their main outlines the three great methods of observation of a transit correspond to the three mentioned above. The photographic (as also the direct) method is intended to determine the exact position which the planet seems to have on the sun's disc; the method of durations is directed towards determining the length of time occupied in the whole transit, that thence the length of the apparent path, and thus its distance from the centre may be determined; and the Delisleian method contents itself with estimating the exact moment and position of contact (either internal or external, and on ingress or egress); in all cases, with the intention that by comparison with a similar observation from some widely distant place on the earth's surface, the difference produced by this distance may be ascertained. In 1761 and 1769 attempts were made to utilize transits of Venus in the way we have mentioned, but errors, chiefly arising from the then little-understood peculiarities of the phenomenon affecting accuracy of observation, lead us to doubt whether the results were so good as others that have since been obtained by direct observations of Mars, as explained above, and it is to set this question at rest that the present observations of the transit of Venus have been undertaken.

It is scarcely necessary to remark that, from the above considerations, no observation of the transit from a single station is of any value by itself in enabling us to determine the sun's distance. For this purpose the observations must be taken in pairs, such stations being chosen as will combine best with one another. Take, for instance, the method of durations, and suppose a good observation to have been taken at Hong Kong. The difference of the duration of the transit when viewed from Hong Kong and from Melbourne is about seventeen minutes; while the difference when Crozet Island is taken as the southern station, is twenty-five minutes. Thus an error of a second in the former pair of observations would make a difference half as large again in our results, as would the same error in the latter pair. It is this that causes astronomers to scan with such eagerness the fresh telegrams that from time to time come to hand telling of the respective success of each expedition. Had the phenomenon been one like a total eclipse of the sun, where the observers are separated only to diminish the risk of complete failure from bad weather, the first telegram received would have set all minds at rest; for when so practised an observer as Colonel Tennant has magnificent weather and is able to take one hundred photographs, nothing is left to be desired so far as results obtainable from that station are concerned. Since the receipt of that welcome piece of news we have learnt much about the other observing parties, and though the intelligence is but partially satisfactory, yet we know enough to warrant our considering that the observations taken as a whole have been highly successful. In Egypt, save at Alexandria, at Melbourne, at Indore, and at Telouan, complete success has been obtained; and what is almost best of all, a telegram from Dr. Janssen, the inventor of the photographic method of observation, and the one in whose hands it would be likely to produce the greatest results, has been able to obtain very good observations at Nagasaki, one of the best stations for that method. The failures at Alexandria, Adelaide, Shanghai, and Tashkend can be borne, as none of these stations are of such critical or exceptional value that the loss of results obtained from them cannot be remedied by observations from the neighbouring stations; but the very moderate success at the Siberian stations is well nigh irreparable. We still lack information from twelve of these stations; but it would seem that there was widespread haze and cloud over the whole of the region in which they were placed, and our prospects are rendered more gloomy by the fact that Wladivostok, from which we had the earliest and most detailed information, is in later telegrams spoken of as one of the places where the weather was most favourable, whereas we know that it was very far from being what could be desired. The main interest now centres in the parties at the Sandwich Isles and those in the Kerguelen and Crozet Islands. If these, and especially if the first mentioned, have failed, the loss will be great indeed, for they stand well nigh alone and unsupported. It will be long before any news of their success or failure come to us, unless indeed homeward-bound ships of Mr. Green's magnificent Australian line are able to carry out their owner's project of calling at Kerguelen Island, and bringing us the news. If at this station the observations are satisfactory, we shall indeed have cause to congratulate ourselves. We already know that good observations have been made at Nagasaki, and as the difference in duration between the transit there and at Kerguelen Island is twenty-eight and a-half minutes, the observations must be inaccurate indeed if we cannot obtain a result which shall not err to one-two-hundredth part of itself, and we may hope to attain to a still greater degree of accuracy.

We have said that observations must be looked at in pairs, and not singly. This it is that makes all astronomers so anxious to receive detailed accounts from the different observers, in order to ascertain how far we shall in this transit be baffled by a not fully understood peculiarity which was doubtless the main cause of the failure in 1769. The time taken by the planet in moving across

the sun's edge is considerable, and, whether from irradiation or some other cause, it does not seem to have a circular shape during the whole of the passage, but will at the end of the ingress and the commencement of the egress seem to be wholly on the face of the sun, but to be connected with its edge by a black ligament. Now it is a debatable point which is the exact moment of ingress or egress; whether it is the moment when the ligament is broken, or when it suddenly changes in a particular way well known to observers; but this is a matter of very little importance provided all observers agree to observe exactly the same phase. The error in 1761 and 1769 arose from the astronomers not fully knowing what to expect, and, in consequence, having to make up their minds at the time what special phase of the contact they should take as the moment of true contact. To remedy this, all the English and American observers—and we believe also those of other nations—have for months been practising themselves at artificial transits of Venus. A black disc of the right size sunk in a glass plate is made to pass over a brightly illuminated field of the same angular diameter as the sun's disc at exactly the right rate, so that all the phases of the actual transit occur in the same order and at the same rate of succession. The value of such practice can only be judged of by those who know what a difficult task it is to take an observation at an exciting moment. So well does this seem to have answered, that accounts from Cairo say that the actual transit was so much like the artificial one that it was hard to get rid of the idea that it was not model practice. If it has been the same at other stations, the accuracy of our final results will be increased to an almost incredible extent, for there can be no fear that there will be any confusion as to the exact phase observed and noted by each observer. But in Dr. Janssen's telegram there is an ominous statement that no ligament was seen. If so, the phases of the transit were different at his station from what they were at Cairo, and what they have probably been at other stations. This destroys all certainty in the comparison of his observations with others, as it will be impossible to identify corresponding phases. The telegram is not very full, and the phenomenon of the ligament is so well known, and has been so universally observed, that it is scarcely possible that it can have been absent, and Dr. Janssen would have seen it if it were there, so that there is still ground to hope that we may have mistaken the meaning of his message. But we must obtain fuller accounts both from him and from others before all anxiety on this subject is removed.

The exciting and interesting part of the work connected with the transit is over, but the really hard work is only just beginning. Each observation must be separately corrected for instrumental errors from data procured at the place of observation, from repeated observations of the sun and stars during the long period (in some cases many months) that elapsed between the fixing of the instruments and the occurrence of the transit. Each photograph will be subjected to the most refined micrometric measurements, repeated dozens, if not hundreds, of times in order to ensure complete accuracy in the determination of the position of the little black dot upon the sun's image; and when the separate observations have been thus prepared, they will have to be combined in pairs, and separate results obtained from each pair. All these results will probably differ, or at all events no one can be taken to be absolutely accurate, so that a further calculation must be made as to the result which is the best approach that we can make to the truth, and what degree of accuracy we may safely consider it to possess. It is this last calculation which will possess the deepest interest to astronomers. It will be but little satisfaction to them to find that the result finally obtained supports one or the other theory of the sun's distance, if the separate results differ so widely that no special reliance can be placed upon it, or, to use the technical phrase, the "probable error" is large. But it must not be imagined that all this vast amount of labour will fall to the lot of skilled astronomers such as those who have organized these expeditions. Mysterious as it may seem to outsiders to make an observed difference of duration in a transit give to us the distance of the sun from the earth in miles, yet the persons who make the requisite calculations are generally people who barely know the elements of trigonometry and algebra, and are, it is needless to say, utterly ignorant of theoretical astronomy. The requisite formulæ are obtained by astronomers, and copies are given to the patient computers who substitute in these formulæ the actual numerical values of the quantities, and work out the most difficult calculations without a glimpse of intelligence of what they are doing, and consequently without as much chance of error as so many calculating machines. No better instance of the advantages of the division of labour can be given, for it would fare ill with results were it necessary that reliance should be put on the powers of skilled mathematicians to multiply two numbers together correctly, and the computers would of themselves be unable to understand, much less originate, a single one of the many processes by which we arrive at the formulæ which they so unerringly use. But the public must wait whilst this vast amount of work is being got through. The astronomers have doubtless done their share already but the computers will not be able to begin for some time yet, and it will not be till long after that time that we shall learn in a form intelligible to the ordinary mind what the transit of 1874 has to tell us.

A NEW FABLE OF THE BEES.

NATURAL history may be said to have passed through three stages. There is the good old natural history which supplied Sir Thomas Browne with his *Vulgar Errors*. The animal world then included a number of charming creatures which have since entirely disappeared even from the imaginations of mankind. The dragon was still to be found in remote Alpine districts, and the stone cut from his head was understood to be a sovereign remedy against most known diseases. The phoenix, though the excellent Sir Thomas brings divers good arguments to render his existence doubtful, was still not unlikely to reward the researches of some traveller in Central Africa. Then there were the unicorn, and the roc, and the dog-headed man, and the still more remarkable man with one foot, which served on occasion for a parabol. But in the days of our infancy such fabulous creatures had disappeared from any region nearer than the *Arabian Nights*; and the modern lecturer upon natural history was represented by the popular showman. That "amphibious" animal which, though it could not live on the land and died in the water, did pretty well in a cage, represented a certain fabulous element, but for the most part our imagination was satisfied by quaint anecdotes about really existing animals. That was the period in which we firmly believed in the lion of Androcles, in the magnanimity of lions generally, in the power of dogs to see ghosts and foretell deaths, and, by way of counterpoise, in the extreme stupidity of the proverbial ostrich. The animals of that period lived upon a borderland between romance and history. As in the legends of Arthur and Charlemagne, there was a certain nucleus of history concealed by an imaginative colouring. But the good old anecdotes, once believed as implicitly as our Bibles, are disappearing before the advance of modern science. Mr. Darwin has in some ways materially raised our estimate of apes and dogs, but he has encouraged us to substitute the disagreeable practice of rigid inquiry for the more pleasant and poetical process of imaginative manipulation of facts.

Amongst the animals in whom we specially believed were the bees and ants. To the ant as a business-like animal, with a detestable habit of uncensured industry, we always entertained a considerable dislike. He resembled the good boy who was a kind of standing reproach to his weaker brethren; and deserved to be put down on the same principle which makes the member of a trade-union protest against the workman who displays a supererogatory diligence. How much superior was the judicious monkey, who would not talk lest he should be made to work! For the bee, on the other hand, we always had a considerable tenderness. Though rather obtrusively virtuous in the strains of his laureate Dr. Watts, he was undoubtedly associated with honey; and much must be forgiven to a creature whose excessive development of conscience led, though unintentionally on his part, to so agreeable an addition to our own private comforts. Sir John Lubbock, however, in a pleasant lecture reported in a recent number of the *Times*, has been endeavouring to throw additional light upon the manners and customs of bees; and we cannot say that his revelations are altogether satisfactory. The bee, according to the opinions of previous observers, was remarkable, amongst other things, for his strong social instincts. The community of bees, indeed, has often been taken as a kind of natural model for human imitation. Their loyalty and vigorous spirit of co-operation is as admirable as the summary way in which they are said to settle questions of poor relief by deciding that, if a bee cannot work, neither shall he live. One of Sir John's experiments, however, is calculated to expose the character of the bee upon an important point. He placed a honey-comb in a position where it could not be easily discovered by bees, and then brought a single bee to this magnificent mine of wealth. The bee continued to visit the honey from half-past twelve till the evening, returning to the hive in the intervals. But no other bee visited the place. Hence, says Sir John, it seems probable that bees have not the power which has been attributed to them of communicating to each other a knowledge of facts. The argument does not seem indeed to be absolutely conclusive. Suppose that a superior animal were to examine our proceedings as we examine bees. They would select one of those industrious persons with whose habits Sir John Lubbock is tolerably familiar, who swarm daily round the great hive called the City of London. He would place a large store of gold or bank-notes in a position not readily accessible to the general mob, and then introduce to it a good human bee, who had previously shown his industry by gathering up gold bit by bit in the dirtiest places and by the most laborious industry. What would be the most probable course of action of the animal under the circumstances suggested? Would he immediately display a power of communicating his knowledge by marking little bits of white material and sticking them up in the most frequented haunts of his fellows? Or would not the observer very probably record a series of phenomena not unlike those which presented themselves to Sir John? We can fancy that the lecturer would have to state that the selected bee had remained for some time in the neighbourhood of the store until certain receptacles in the neighbourhood of his thighs were entirely loaded with a yellow substance; that he carefully avoided contact with his fellows; and that he returned frequently to the spot, paying visits in the interval to a great central storehouse in the midst of the hive. The question is, whether Sir John's remarks are more destructive of the intelligence or of the moral character of the bee.

Is the insect sharp enough to keep its knowledge to itself, or is it too dull to be able to communicate the facts? It is rather difficult to speculate upon the motives of beings so far removed from us in the scale of creation. There is a well-known passage in Paley which is reported to have stopped his promotion in the Church, by the shock which it gave to the conservative prejudices of George III. If, says that admirable writer, you should see a flock of pigeons in a field; if you should see ninety-nine of them gathering all they got into a heap; reserving nothing for themselves but the chaff and refuse; keeping this heap for one and that the weakest, perhaps worst, pigeon of the flock; sitting round and looking on all the winter whilst this one was devouring, throwing about, and wasting it, and tearing to pieces any pigeon who dared to interfere with the arrangement, you would see nothing more than what is every day practised and established amongst men. We need not go on to Paley's application of this ingenuous parallel. The superior creatures which "show a Newton as we show an ape" might hastily consider such an arrangement to be a singular proof of the unreasoning stupidity of mankind. They would declare that nothing could keep up such a state of things, except a blind instinct incapable of reasonable explanation. When we examine the ways of bees, we may be subject to a similar illusion. The superior being in the supposed case sets down to our stupidity what is really the effect of our enlightened selfishness. Communism is impracticable, because men will not work without some personal reward. By the inverse process, Sir John Lubbock is perhaps exalting the virtue of bees at the expense of their intelligence. The bee may contribute to a common fund, because the conditions of his life make private property generally impossible; but as soon as he sees his way to keeping something for himself, he seems to take advantage of the opportunity. A still greater perplexity would be produced in the case of the human bee, if a whole hive were to be watched making elaborate preparations to extract honey from a block of stone. The observer would probably set them down as hopelessly idiotic; and yet, if all stories are true which are told on the Stock Exchange, such manoeuvres show the extreme acuteness of some individuals as much as the folly of the mass. Sir John should try a new experiment, and see whether, if he exposes a mere painted honeycomb, his bee would not send to it a whole crowd of his fellows, and stay comfortably at home wallowing in more honey than ever gladdened the heart (we speak metaphorically) of a single bee before.

Meanwhile it seems that our old objects of antipathy, the ants, have a simpler character or a keener intelligence. One ant, being introduced to a cunningly devised platform with a provision of honey, went off to the nest and brought back as many as twenty of his fellows. We cannot speak too highly of the public spirit exhibited by this virtuous insect. A certain slur has been cast upon ants by the statement made popular by Mr. Darwin that some ants are in the habit of keeping slaves. We know not whether any virtuous abolitionists have taken the question in hand and proposed a suppression of this degrading traffic. Knowing by experience what it is to fall asleep upon a large ant-hill, we should feel prepared to take a very severe view of any such delinquencies. And the argument will be all the stronger now that it is stated on high scientific authority that an ant, contemptible as may be his appearance, is in reality capable of the social virtues. We would suggest, parenthetically, that this interesting experiment might be carried out in a different direction. We feel that there is strong reason to suspect that insects more generally unpopular have a very similar instinct—or, should we say?—power of reasoning. We have placed the human frame upon a bed in a position which we had taken every means to render impregnable to the domestic flea. And yet, within a few minutes after the first enemy of the human race had tasted blood, the body used in the experiment has been assaulted by legions sufficiently numerous to inflict unreportable tortures. This however, is merely thrown out by way of hint. The observations reported by Sir J. Lubbock are really interesting, whatever interpretation may be put upon the facts. It is a curious question how far we are justified in applying anthropomorphic conceptions to the ways of insects. Whatever philosophers may say, we are quite unable to imagine that dogs and horses are mere senseless automata; and indeed we find it impossible to suppose that they do not go through intellectual processes which contain at least the germs of human reason. But when we come to beings organized on such entirely different principles from ourselves, we are half disposed to fancy that they may have modes of combining their impressions which are different in kind as well as degree from those with which we are familiar. We leave the problem to metaphysicians, and refrain from attempting to imagine what would be the effect of making acquaintance with the outside world through a pair of antennæ. We can only say that the recommendation to the sluggard to go to the ant must now be understood in a new sense. He should go not merely to find a symbolic representative of the virtue in which he is most defective, but to discover an actual exemplification of a Christian spirit. And his sluggishness will be reprov'd not merely by the ant's industry, but by the recognition of the fact that new fields of knowledge are open to any one who will take the trouble to investigate familiar phenomena.

MONS SACER.

WE know not whether we are right in assuming, or whether so to assume is only a judgment of charity, that every visitor to Rome makes a point of going at least as far out of the city as the noble church of St. Agnes without the Walls. Of that church in its character as a basilica—in some points, notwithstanding its comparatively small size, the most finished and perfect of all basilicas—we have spoken in times past. And we have also raised our nose over the neighbour of St. Agnes, St. Constantia, and the tomb stolen thence by the barbarous whim of a destroying Pope of modern times. Papal caprice glorifies Agnes and robs Constantia; the lover of Christian antiquity can only wish that Popes would keep their hands alike from glorifying and from robbing. But just now we have to deal with both buildings simply as a landmark; they are to us for the nonce no more than the villa of some mushroom "prince" on the same road, who has amused himself by setting up sham ruins, and sometimes, it is whispered, stealing real columns to cke them out. We set out along the *Via Nomentana*; we pass by the gimcrack Colosseum of the prince; we pass by the two churches which have fared in such opposite ways at infallible hands; we ask ourselves the purpose of the ruin which stands in their close neighbourhood, and which, like so many others, bears the name of Maxentius; and this time we do not turn back when we have reached the basilica, but go on along the somewhat dreary road in search of a spot which tells us of days when Rome had as yet no prince but her *Princeps Senatus*, no Pontiff but the head of the religion of Jupiter and Minerva. But before we altogether cast the modern world behind us, we are forcibly reminded of its presence as we cross the modern substitute for Appian and Flaminian ways, the network of railways which carry out the saying that all roads lead to Rome. Nor is the reminder out of place; the great works of ancient and modern engineering skill have much in common. There is a likeness, sometimes even in their actual appearance, always in the mighty spirit of enterprise, the command of physical resources, which is alike common to both and unknown to intermediate ages. We cross the iron road and go down into the valley of the Anio; we pass over a bridge, of which more anon, and we find the other side of the stream guarded by a group of low hills whose place in history is no mean one. There is more than one among the neighbouring mounds which claims to itself the honour of being the spot where the Sacred Laws were passed, where the tribuneship was ordained, and where Agrippa Menenius spoke his famous parable of the Belly and the Members. About the exact spot it is idle to dispute. Gibbon says that people often forget that a battle is not fought on one particular spot, because two armies in action cover a good deal of ground. And so the place to which the Roman Commons seceded with the object of founding a new city must have been something more than any one of the little knolls more than one of which is marked in different maps as the exact spot. The contemplated city, the actual encampment, must have taken up a good deal of ground. It is enough that it was on those low hills beyond the Anio that the Commons designed to found their city of refuge from patrician oppression, and that some one of them, likely enough the small, but marked, knoll just beyond the river with two ancient tombs at its foot, was the actual spot which kept to after ages the honoured name of the Sacred Hill.

The legend of the secession of the Commons is one of those stories which come before the time of trustworthy history, but whose general truth there is no reason to doubt. It gives an account of the origin of an important part of the Roman constitution, of the Sacred Laws and of that memorable office of the tribuneship which those laws so specially hallowed. Stories which give the origin of laws and offices are very often among the silliest of legends, because they are in truth no legends at all, but mere guesses to explain something whose meaning was forgotten. But the story of the secession to the Sacred Hill is not one of this kind. It will stand the test of the comparative method. It is in every way probable, according to what we know from analogy must have been the real state of things, but it is not a story which a later age would be likely to invent. It takes for granted the real origin of the Roman Commons. Had the Commons been simply the poor or ignoble class of Rome, like the poor or ignoble class of a modern State—had they been, as Livy conceived them, a class artificially divided from the patricians by the first founder of the city—we can hardly fancy them forming the plan of leaving Rome, and setting up a new town of their own in the immediate neighbourhood. In a modern State, or in such a State as Livy conceived Rome to have been, the poor and ignoble, even though they may be wholly shut out from the government of the State, are still as much members of the State as the rich and noble. But, when we take in what the Roman Commons really were, we shall see that it is only in a very imperfect sense that they were members of the State at all. The patricians were the old citizens, the Commons were the new. The patricians were the men of the old settlements on the Palatine and the Capitoline, strengthened probably by the Luceres of the Cælian. The Commons were the later settlers on the Aventine, dwelling indeed physically within the city wall, but not admitted within the sacred shelter of the *pomerium*. They had not yet been incorporated with the elder tribes, as the elder tribes had already been incorporated with one another. Many among them might be rich, many among them might have been noble in earlier homes, but neither riches nor nobility could win for them political equality with the elder

citizens. It is not very wonderful if on such men the tie of local allegiance sat very loosely; they were only half Romans, and it seemed to them no strange thing to leave Rome and plant a new town somewhere else. In such a town they would be the old citizens, and a day might come when they might have the pleasure of being themselves patricians towards fresh bodies of new settlers. There they might have their own gods, they might take their own auspices, they might do what they would as an independent commonwealth, perhaps a thirty-first Latin city. All this they could easily do; because they were not mere units, like those members of a modern State whom poverty or any other cause shuts out from a share in its government; they were an organized community, with their own assemblies and magistrates, and with the full habit of united action. The Sacred Hill was not an Adullam where every one took refuge who was discontented or in debt; it was a spot to which a community which at Rome was dependent proposed to move in order to become independent. The whole thing is perfectly in harmony with all that we know of the way in which early communities grew up. Till all the elements of the State were fully welded together, secession was a natural resource, more than once resorted to by the element whose citizenship was imperfect. As the old distinctions die out, secessions cease to be heard of. When, in the later days of the commonwealth, we come to dissections of quite another kind, we do not hear of secession as a remedy. The idea is as wholly foreign to the later state of things at Rome as it is natural in the earlier. The story bears about it the stamp of being genuine tradition, and not an invention or a guess of later times.

In all the disputes between the patricians and the Commons, we naturally take the side of the Commons, as the cause of freedom and equal right against an exclusive oligarchy. But this story, like many others, shows that the patricians were the truer Romans. No wonder; they were the old settlers; they came of the pure blood of the founders of the city; theirs were the Gods of the city, whose will no man of the stranger Commons knew how to interpret. Their love for Rome, as a spot, as a city, as a commonwealth, might be narrow and selfish, but it was strong and real. Their love for Rome involved the dominion of Rome over other commonwealths, and their own dominion in Rome; but they had at least no objects apart from Rome; they sought no greatness for themselves in any character but that of Romans. To secede from Rome, to divide Rome, were thoughts which to them were worse than death. The time came when all barriers were broken down, and when these feelings were as strong in the plebeian as in the patrician; but it was not so as yet. The patrician was already rooted to the soil of Rome; the plebeian could still endure the thought of ceasing to be a Roman. The patricians were not ready to grant equal rights to the Commons; but they saw that a secession of the Commons would be the ruin of the Roman commonwealth; they saw that a purely patrician Rome could no longer stand. To hinder the division of the commonwealth, they were therefore ready to make large concessions to the inferior community, but concessions which marked out the Commons as a separate community almost more distinctly than before. By so doing, as afterwards by hindering the proposed emigration to Veii, they undoubtedly saved the Roman State. The greatness of Rome was so closely bound up with the site of Rome and with the associations of Rome that we may be sure that a new city by the Anio, or a Roman commonwealth transferred to Veii, could never have become what the true Rome by the Tiber did become.

It is a point to be noticed that, whichever of the hills we may pitch on as the actual *Mons Sacer*, the new town by the Anio would have been out of sight of Rome. From the hill just above the river, and from the hill a little way further on, the eye catches some of the loftiest towers and cupolas of mediæval and modern Rome; but that is all. Of the city, as it stood in the days of the secession and for many ages after the secession, nothing could be seen from the Sacred Hill. In this there is no doubt a moral. Tusculum might look down upon a hated rival. We may doubt whether the city of the *Plébs* was meant to be a rival or an enemy of Rome. We may fancy that a wish to forget Rome was mingled with a sort of half attachment to the old spot, which forbade the discontented community to migrate to any great distance. But what would have followed if the parable of Agrippa Menenius had had no effect? No one can dream that the town on the Anio could have grown into so much as the head of Latium. But the division, the secession, the probable border-wars between the old and the new city, might have hindered the town on the Tiber from becoming the head of the world.

That the secession really was made, according to Livy's account, to a point, like the Sacred Hill, beyond the walls of the city, there can be no reasonable doubt. Livy quotes from Piso another version, according to which the secession was made to the Aventine. This he wisely rejects. But Piso's story is valuable, as showing the way in which legends were arbitrarily patched up. Piso, or those whom he followed, knew that there was a special connexion between the Commons and the Aventine, and so thrust in the name of the Aventine in a story about the Commons in which it was quite out of place.

One point more. It is not unlikely that here, as in so many other places, we are brought face to face with some of the strange contrasts of history. The hill nearest to the river looks down on one of the most picturesque of covered and fortified bridges, clearly of more dates than one. Some hold that part of the structure is the work of Narses. This bridge on the *Via Nomentana* must not be confounded with the more famous bridge of Narses on the

Via Salaria, which once bore the boastful inscription commented on by Gregorovius. But it is in no way unlikely that he built both. And, looking down from the Sacred Hill, we feel inclined to hope that there may be truth in the opinion of those who assign this bridge also to the first Etrarch. If so, two ends of Roman history are here brought together. We stand on the scene of an event which seemed likely to tear Rome asunder before the elements of her people were yet fully welded together. We stand, three miles from the elder gates of Rome, on a spot where a part of the Roman people dreamed of founding a new city out of sight of the old one. We look down on the work of an age when a Roman Augustus still ruled alike in Spain and in Syria, but when a secession of another kind from that which led men to the Sacred Hill had removed his throne from the Tiber to the Bosphorus, and when another secession stranger still had for a while cut off Rome herself from the Roman Empire. As the voice of Menenius had won back the severed Commons, so the arms of Belisarius had won back the severed capital. In the one case the New Rome, if a New Rome it was to be, was, before its birth, again incorporated with the Old. In the other case the Old Rome was not indeed incorporated, but brought into subjection to the New. Menenius might well boast that he had given Rome peace and freedom. Justinian too boasted that he had given Rome peace and freedom; but it was such peace and freedom as was consistent with the position of an outlying province and with the rule of a Byzantine Etrarch. But the very degradation of Rome took a form which was the direct result of her greatness; she became the slave of her own name and her own shadow. Had the Roman people parted asunder at the Sacred Hill, the Roman name could never have won the magic power which it did win, a magic which could live, not only through the transfer of Rome's name and place to her own colony, but through the actual subjection of the parent to the child. There is a cycle in all things. Rome, as the legend goes, destroyed her own metropolis. If so, the wrongs of Alba were strangely and tardily avenged when Rome became a dependent outpost of Byzantium.

AMATEUR NURSING.

AFFECTION only, however warm, will not qualify a sick-nurse. The cool head and steady hand of a professional stranger is too often to be preferred. Many a life has been sacrificed by ignorance or stupidity or anxiety where the nurse would gladly have died to save the patient. The event of a fever has before now been determined by the clapping of a door, or by an injudicious spoonful of unsuitable food. The indulgence may prove fatal of some whim which a fond mother cannot deny to her sick child. The longed-for change of posture may be accorded a day too soon. The cruel application of another blister may be put off a day too long. A moment's thorough draught, a cup of tea, a piece of news, a second pillow may settle the struggle between life and death. How often the doctor leaves a house feeling that it is only in spite of the nursing that his patient will recover! He shudders to think of the messes which will be brought up as beef-tea. He is in despair when a poultice is prescribed, as he is almost certain it will be so applied as to do more harm than good. And, valuable as all kinds of baths are in illness, he dare not order them, knowing the insane way in which his orders will be carried out. Above all, he is afraid of what may be termed the "cumulative dose," whether of medicine or nourishment; and finds it impossible to persuade either the patient or his family that half a dozen table-spoons of brandy in half a dozen hours are not the same thing as one glass in six hours; or that, where he orders medicine to be taken every two hours, the effect will not be the same if a double or treble dose is taken at once to save trouble.

There is a strong and not altogether unreasonable prejudice against employing professional nurses, and especially hospital nurses, as long as the amateurs hold out. "Sisters" are resorted to now in many cases, but unfortunately there are benighted souls who do not like "Sisters," delightful as they are often found to be; people who are puzzled about their position, like Lord Dundreary about Sam; patients who associate them, perhaps not unnaturally, with confession and extreme unction. It is ill-naturedly said that, unless sisterhoods were uniform, ladies could not be found to go into them; that the coffee-coloured or black dress, the becoming straw bonnet, and the silver crucifix have an effect on the female mind like that produced upon every boy by the aspect of a life-guardian in his panoply; but it is certain that many sick people who have to submit to hired or professional nursing of any kind would prefer to see no white lawn or blue serge, no rosary or knotted cords. There is an opening for what may be called medical assistants, to take a place between lady doctors and ordinary sick-nurses. They might be taken from the class which now supplies the suffering fellowship of governesses, already too numerous; and from which companions who are no company are now drawn. They would require to have the keen perceptions and nice ways of ladies, yet they must not be above supplying all the patient's needs. Their training ought not to be made expensive; for women are apt in learning these things; hands which could never play a sonata of Beethoven might adjust a bandage, and voices whose singing would be painful to hear might soothe the sick one's ear with kindly words. Where the lady of the house is laid up such a nurse could answer her letters, see a visitor who called to inquire, read the newspaper intelligently, talk of something besides the

dying agonies of her last case, and perhaps judge wisely when the patient must be kept quiet and when she may see a friend. Such a person could without offence dismiss a visitor who stayed too long, and assume the responsibility of allowing the children to see mamma, while she ordered their goings to prevent a racket or a cry.

But it is painful to see a patient nursed in the common manner. The tact required for a sick-room differs from all other kinds of experience. Amateur nurses seldom possess it. Now and then a lady is to the manner born, and without instruction or previous experience blossoms into a full-grown nurse at a moment's notice. The doctor who finds one ready in a house rejoices heartily. His own credit as well as the recovery of his patient is probably assured. Seldom, however, has he this good fortune. His ordinary experience is very different. If he wishes the sick-room kept at a certain temperature, he cannot have it managed. The fire is alternately half extinct and blazing up the chimney. There is no care to have it warm at sunrise and sunset, and moderate when the sun is shining and the air warm. The invalid is awakened from a priceless sleep by hearing the cinders fall on the unprotected fender, or by the noise of a clumsy hand putting on coals, which might easily have been wrapped in pieces of damp paper and left ready for noiseless use. The morning meal is perhaps delayed until the patient has passed from appetite to faintness. Perhaps, when it comes, the tea is smoked. Household troubles are freely discussed in the room. Mary has given warning because there is so much more going up and down stairs since Missus was ill; the cook is so extravagant, and yesterday's dinner was spoilt; Johnny has cut his finger, and Lucy has tumbled downstairs; such things are told as if they would amuse the invalid. But worse than this is the mysterious whispering at the door, and the secrets obviously kept to excite the nervous patient's suspicions. The irritating creak of a dry boot, the shuffling of a loose slipper, try a sick person's patience unreasonably; and the amateur nurse argues against such silly fancies, and thinks they are matters in which reasoning can be of any avail. The untrained nurse never commences her arrangements for the night until the patient is just beginning to grow a little sleepy. She then arranges the pillows, moves the chairs, stirs the fire, and perhaps makes up her own bed. Such snuses at sleeping-time produce fever in a most unaccountable way, and the amateur is amazed and bewildered because the patient lies awake all night. Besides all this, and no matter how noisy and elaborate the preparations for the night's campaign, several things are forgotten downstairs; no beef-tea is to be had in the middle of the night, no spoon for the medicine, no boiling water. Amateurs do not know that sick people should not be asked what they will have, but should be saved even the mental exertion of making a choice. However desirable it may be that they should arrange their affairs, business matters should not be discussed before them. Sometimes a man who has not made his will before his illness will be anxious and uneasy till he has made it, and will get better when the matter is off his mind. But to arrange such things requires nicety and tact such as the amateur, who perhaps shares the sick man's anxiety, cannot show.

In convalescence, even more than in illness, the attentions of an inexperienced nurse are often trying to the invalid. If he has been well nursed he is still amenable to the discipline of the sick-room, and will probably do what he is bid. But if he had not learned unquestioning obedience to a benevolent but irresponsible power, he has many things to suffer before he gets well. At first, perhaps, he will be allowed to sit up hours when minutes were the doctor's orders. He is able to persuade his nurse to give him a tumbler of claret, when the medical allowance was a wine-glass. He is allowed to see the newspaper for a few minutes, and he reads an exciting novel. He is permitted to see a visitor, and has a room full of company. He is overloaded with mufpling when he takes his first walk, and is allowed to sit on a cold garden seat. When he goes home, no nourishment is ready for him, and the chances are his house clothes are unaired. And as he gradually emancipates himself from the bondage of illness, and returns to ordinary life, it is seldom that his reviving appetite is properly humoured. The *sequelæ*, as they are called, of many fevers are both induced and aggravated by the carelessness by which unwholesome food is offered to the recovering invalid. This is even more often the case where there is chronic illness or delicacy of constitution. It is amazing to see a man suffering from a deadly complaint set down to a dinner where he has to choose between stewed kidneys and salt beef. If he is cautious, which is not often the case, his hostess will wonder to see him prefer a bread-and-water diet. But the entire ignorance of what constitutes wholesomeness in food is a curious feature in the character of many housekeepers. In all diseases of the respiratory organs the importance of care in adjusting the temperature, especially at night, is seldom thought of; yet a little trouble taken in time has often saved a delicate constitution from falling into consumption. Even in a bad climate it is only by experiment that any one can tell how far this terror of all families may be escaped. People are wholly demoralized by fear when its name is mentioned. Medical men who hesitate to use the word, knowing what despair it will lead to, are accused of deceit. The frantic parent whose child is threatened tries all kinds of experiments, rushes wildly from place to place, consults all kinds of quacks, uses half a dozen methods of treatment, perhaps all at the same time, alternately keeps the patient constantly in the open air and secludes him altogether, and when the end, inevitable in such cases, comes at last, is subject to lifelong self-questionings as to whether anything more might have been done. Some people,

again, are never to be warned of danger until it is too late. The doctor's grave looks are unseen, his warnings unheeded, and then he has to bear the blame of the result. When a death occurs for the first time in a household, the calamity comes with a crushing force. Everybody is thrown off his balance; all kinds of reasons have to be invented for what is unfortunately a too common occurrence. The right reason is seldom thought of, for all that love and anxiety could do has been done. But the doctor requires something more, for love and anxiety are not always helps to him. A little exact and unreasoning obedience to his orders, a little disregard of the patient's morbid cravings, a complete absence of any display of nervousness or fear, and his patient's chances are doubled. It is a pity Mr. Ruskin has never turned his practical mind upon these matters. His Utopia is to consist only of young and healthy people; and in one of the recent numbers of *Fora Clavigera* he defines women's work without any reference to nursing. He says they are to please people, to feed them in dainty ways, to clothe them, to keep them orderly, and to teach them. He says not a word about nursing them in sickness; possibly he contemplates the institution of "Euthanasia."

CLERICAL MEETINGS, PAST AND PRESENT.

WHATEVER may be the surprises in store when the ensuing Session of Parliament introduces the next instalment of ecclesiastical legislation, one condition of the contest appears by general consent to be anticipated as certain. The influence of the majority in the Lower Houses of Convocation is not expected to be thrown into the same scale with the vote, as given last Session, of the majority in the House of Commons; or, in other words, the relation of the representatives of the clergy to those of the nation generally appears likely to resemble the relation which during many years past usually subsisted between the provident opinions of the Upper and Lower Houses of Parliament. Forty years ago no such contrast of opinion could be anticipated, for the simple reason that it could not have been expressed. The voice of Convocation could not be heard, not merely because it was not allowed, but because it was impossible. The representatives of the clergy were dumb because their constituents, in any corporate or combined action, were dumb also. The clerical meeting was an institution nearly, if not quite, unknown to the outside world. It has now taken its place among the most active and carefully organized influences of the time. Whether the action of the Lower Houses of Convocation is beneficial to either Church or State is a matter on which diversity of opinion may exist, but no one doubts that Convocation has become a power to a considerable extent, and it has become so coincidently with the increasing energy of its constituencies. The two facts may fairly, therefore, be regarded as in the relation of cause and effect, just as the increased energy of political life in the nation has its result in the growing power of the House of Commons.

Among the petitions which are annually presented to Parliament upon all questions of religious or ecclesiastical, and upon most questions of social interest, an appreciable number are now sent up from the clergy of the Rural Deaneries. The origin and object of these minor ecclesiastical divisions is matter of simply antiquarian interest; their uses, till quite recently, were entirely dormant and obsolete. When the Clergy List was first published in 1841, the various benefices in each archdeaconry were printed in a list "arranged under" these "ecclesiastical divisions," each bearing its ancient name; but not a single Rural Dean is mentioned, nor does the office seem to have been so much as thought of. In the issue for 1852 a few dioceses or archdeacons appear with the names of these officers inserted, but in the great majority of cases the old state of things continues. Eleven years later, in 1863, the instances in which the Rural Dean did not exist were confined to a very few archdeacons; and in the present year, it is almost needless to add, not a single such instance is to be found. An organization by which every clergyman of the English Church may periodically or as occasion arises express his opinion, and even give his vote, in conference on any subject of importance connected with his office, is complete and in full working order, and the number of clergymen who do not, occasionally at least, take active part in these meetings is probably very small. This is a state of things enough, to adopt Sir William Harcourt's phrase, to make the bones of an archbishop of the Georgian period turn in his grave. Not a wig on the Episcopal Bench, in the days when wigs were worn there, but would have been lifted from the right reverend wearer's head as he stood aghast at the contemplation of an enormity so revolutionary. The clergy ought to meet, at stated times and in proper places, it was true. They were to attend visitations, episcopal and archidiaconal; to listen to what they were told, to eat the visitation dinner, and perhaps to pay their share of the reckoning; to make, or to applaud, speeches of a respectful and complimentary character, and to request that the charge, or the visitation sermon, might be printed for the enlightenment of posterity. There, in the eyes of a Hanoverian hierarch, the function of the clergyman in his corporate capacity ended. Under these conditions the earlier clerical meetings began in a quiet, timid, tentative sort of way, like the introduction of hymns into parish churches under the dynasty of Brady and Tate. They were conferences of the scattered and somewhat unpopular members of the Evangelical school; and as these grew in influence

and favour, so the monthly clerical meeting came more openly out into the light. Probably every clerical Society whose meetings date back more than thirty years originated in this way. The Eclectic Society of London, which was founded in 1783, was an association of this kind, but was not exclusively clerical, nor indeed did its members all belong to the communion of the English Church. All such Societies, however, were in their nature eclectic and private, the members already standing to each other in the relation of personal friends, or naturally growing into it. Ecclesiastical boundaries were not thought of; and the limits of the area from which the brethren could assemble were defined mainly by the powers of the parson's horse or the route of the available stage-coach. Then, on the Tuesday nearest to the full moon, the little band of "Gospel-preaching" ministers would come together for the discussion, and the afternoon dinner, and the prayer before separation, but not for any service in church. The good men had their differences, but these were only on points of millennial or other prophetic interpretation, or perhaps on certain phases of the Calvinistic system of theology. Upon such meetings as these, in 1833, Dr. Newman made, as he relates in the *Apologia*, the first uncertain experiments of "the Movement." When that "Movement" had fully risen on the horizon, the alarm of the clerical meetings was deep and universal. A few of these old Societies still survive, in more or less altered form, and their manner of clinging to old traditions will at times provoke a smile. When a proposal was made by some younger members of one of them to discontinue the singing of the traditional hymn by the united voices of the brethren without instrumental accompaniment, on the ground that the effect upon street passengers through the open window was not conducive to edification, seeing that only one brother could sing in tune, the suggestion was gravely silenced. The hymn had been "a testimony" once, and "a testimony," in tune or out of tune, should it remain.

But the old eclectic clerical meeting is fast dying out, disappearing before the regularly marshalled forces of the Rural Deanery, with its somewhat imposing title of a "Chapter," "ruridecanal," or, as it is now and then called, like its dean, "rural." With the change has passed away every characteristic of the old meeting of the "brethren," except the full moon and the hospitalities, which still survive in the country districts. So complete has the change become, that even London and Westminster, where of course "Rural Deaneries" were unknown of old, have been parcelled out into such divisions, with their incongruous name unaltered, penetrating at length, not without subdued groans from the "intramural" clergy, the sacred boundaries of the "East" and "West City." It is said to have been to one of the new-made dignitaries of this anomalous ecclesiastical *rus in urbe* that a letter was addressed by an awe-stricken and perplexed churchwarden, beginning "Very Reverend and Rural Sir." At first, indeed, the fear of possible danger to established order seems to have suggested limitations to these authorized quasi-capitular conferences; and Bishop Blomfield's Commission to his Rural Deans did not allow them to convene the clergy for any discussion of points of theological or ecclesiastical controversy. This limitation, we believe, no longer exists; and it is stated that Bishop Blomfield's successor has even invited the clergy of his diocese of Canterbury to confer in their Rural Deaneries upon two subjects which would have been most obviously excluded by it; but its force in 1859 was sufficient to dissolve at once, on the point of order being raised, one of the largest of such gatherings ever assembled in London. The substitution of local boundaries and *ex officio* membership for the old system of private election gives an entirely new character to the clerical meeting of our time, and has its great advantages, not unmixed however with very manifest defects. The habitual conference of men of various shades of opinion would be in itself only beneficial, were it possible to unite with it the condition of absolute freedom of speech. This condition in actual experience must be very much controlled by circumstances. It is naturally most nearly satisfied where the members of the conference can meet in a public room or on other neutral ground, as it is possible to do in London and in large centres of population. But this is only necessary where the numbers are too large for the more genial and pleasant method of gathering in a private house; and in direct proportion to the introduction of the elements of personal relations and social hospitality the limitations of perfect freedom of discussion increase. An experienced authority in parochial matters used some years since to remark that, in dealing with an awkward deputation, there was nothing like beginning with a glass of sherry; and the maxim is of wide application. Its principle affects the clerical meeting of a country "Chapter" much more than that of the town. The members usually assemble, after the manner of the more august conferences of the British Association or the Church Congress, in a revolving cycle of hospitality; and those who have house-room and stable-room sufficient or available entertain the "Chapter" in turn. You arrive, it may be, with the most determined intention to emulate John Bunyan's Mr. Valiant-for-the-Truth. You have worked up your resolution to martyrdom pitch, and you mean to deliver your conscience on the great subject of the day. No matter what opposition you may meet, what influences may surround you, you will give no uncertain sound. Then there drives up a well-appointed wagonette of a soberly stylish kind, from which descend a couple of curates, and a neighbouring vicar or two whose coach-houses, as you happen to know, are found very convenient for storing the winter potatoes. The equipage belongs of course to the Rural Dean. This dignitary, who, as has been already noticed, is without any historical pro-

genitors, has been simultaneously in every country district evolved by some process of natural selection. He is always a gentleman; he is, as often as not, a county magistrate; and he is certain to be a personage of some consideration among the magnates of his neighbourhood, and popular with the clergy, while perhaps he is also an authority among the farmers as Chairman of the Board of Guardians. The unimpeachably shining broadcloth which is the material of his coat has been fashioned by a perceptive tailor so as just to indicate the decanal rank without presuming beyond the limit of its rural form; and its wearer is remembered as an active and conspicuous Non-Placet on some hard-fought days in the Sheldonian Theatre. It was easy enough then to do battle with him in the Placet ranks; but single combat in his Chapter is a different thing altogether. Church Service and luncheon ended, he takes the chair; and the host of the day proceeds to read a paper in opening the discussion. It might have been possible after all to face the "Dean"; but the glories of martyrdom finally fade away before your host and his "paper," as in the pleasantest possible of voices he proceeds to denounce, after an uncompromising fashion, everything which you were about to maintain, and to assert dogmatically everything that you meant to denounce. It is quite impossible to hint that a man is an infidel or an idolater in his own house. There is no shaking any dust off one's feet when it has all been left in the "Salve" on the door-mat; and an anathema will scarcely harmonize with the previous admiration of the host's roses and praise of his home-brewed, or with the adjournment about to be moved at half-past four. Thus the general tendency to make things pleasant which springs out of neighbourly association exercises a direct influence on the proceedings of the modern Chapter; and while the asperities of theological polemics are very much smoothed away, there appears likely to be an increasing loss of definiteness in the expression of thought by minorities. The prevailing tone of opinion in the "rural Chapters" may therefore naturally gravitate in one direction, and the aggregate vote of the clergy may exhibit a result corresponding to the preponderance of one political party in the English county representation. The eclectic clerical meeting of forty years since neither possessed nor aspired to possess any influence on national politics, and "our glorious Constitution in Church and State" was moved to no hope or fear by its existence; but the Ruridecanal Chapter of the present day, however we may be inclined to smile at its assumptions of quasi-cathedral dignity, is an institution of a very different nature, and can hardly be set aside with prudence as an element in their calculations either by the Liberation Society or by Parliament.

THE SHAH'S DIARY.

THE Shah has published, for the information of his people, a diary of his tour in Europe. The whole of this simple record of his observations of our own and other countries deserves perusal, but of course we shall be principally interested with that part of it which concerns ourselves. He was impressed with the greatness and wealth of England, and pleased with the heartiness of his reception, and amused with the shows provided for him. It is impossible, he says, to describe the prosperity, the populousness, the extent of London. The crowd was beyond all limits. The women are "most lovely." The soldiers are very strong of frame and beautifully dressed. Their horses are very fine and strong. "One sees and comprehends that they are a great people, and that the Lord of the Universe has bestowed upon them power and might, sense, and wisdom, and enlightenment." Thus it is that they have conquered India, and hold important possessions in America. The Shah's admiration is valuable, because his remarks show sense and shrewdness. The first proof that he has a good eye was his mistaking the front of Buckingham Palace for the back. A juster criticism of that structure could not be made. He admires the garden of the Palace, and describes a mowing-machine which he saw there. He visits the Queen at Windsor Castle, is invested with the Garter, and learns the origin of that Order; he is pleased with Prince Leopold's dress and manner, with the Long Walk, and the deer, and an avenue "resembling Paradise," and he again admires the soldiers, who are well dressed, disciplined, and armed, "being very stout young men." But he is aware that there are not many of them. He knows that the Lord Mayor is only Governor of the Old City of London, and that the remainder of the town has no governor, but each parish has a Council, and if an event happens, it is referred to the head policeman of the parish, and he refers to the Home Secretary. The police are all handsome young men in a particular dress. The citizens greatly esteem the police, and "whoever behaves disrespectfully to them is adjudged worthy of death." He describes the ball and supper at the Guildhall. The supper is correctly defined as "a dinner after midnight," and the practice of giving toasts is properly explained. He goes to "a very large and beautiful" theatre, where some beautiful scenes were acted, and Patti sang most exquisitely. She is "an exceedingly graceful woman." He drives to the Zoological Gardens. "As it was Sunday, the streets were empty, all the people being in the fields and lanes taking walks." This, we must allow, is a nice way of putting it. The Shah was, happily, ignorant that many of these people were exercising the privileges of *bona fide* travellers. He is delighted with that intelligent animal the sea-lion, which understands French. The day of the Windsor Review was cloudy. "We offered thanks to the

Lord that rain did not fall." The Shah admired the Guards, the Highlanders, the Rifle Brigade, Artillery, armour-wearing Household Cavalry, and Hussars. All these were very beautiful, and the bearskin caps of the Guards were "awe-inspiring." He was pleased with the gardens, conservatories, and deer-park of the Duke of Sutherland at Trentham, and was particularly interested with the game of bowls which he saw played there. He thought that the people of Liverpool were poorer and more hardily-worked than those of London, and he noticed the blackness of walls, dresses, and visages in Manchester. He was informed that the ladies of that city usually wear black, for a reason which he thought excellent. But this is rather hard on Manchester, which is certainly not the blackest town in England, and as regards the dresses of its ladies, some envious Londoner must have abused his ear. The Crystal Palace pleased him thoroughly. The acrobats are fully noticed, and the trapezist "performed magic—he flew." The fireworks were very fine, and the fountains most charming. He notices repeatedly the beauty and grace of the ladies, and indeed he says so many pleasant things about us that, if a Persian loan were now to be brought out, it would be likely to be favourably considered in financial circles. He was pleased with a sparring match, and delighted with Mme. Tussaud's waxworks. Perambulators, with children in them, charmed him, and he thoroughly enjoyed the dancing and singing at the opera. Above all, he believed that the people of England were sorry when he went away. The Diary explains, and goes some way to justify, the popular excitement about the Shah. He must have made it appear that the guest was pleased, and that was a certain way to put the hosts into good humour. It is remarkable too that next to England he seems to have liked Austria best of all the countries that he visited, and there are undoubtedly many points of similarity between the two nations which pleased him most.

The Shah quitted his capital, Tehran, on the 19th of April, 1873, and journeyed by land and water to Astrakhan. On the 16th of May he wrote, "Thanks be to God, we have escaped from the high sea, and have entered a large river named the Volga, which has a great charm." He ascended this river to Astrakhan, and thence to Tsaritsain, where he took the railway for Moscow. "This," he says, "is the first time we travel on a railway, and very nice and comfortable it is." At Moscow he visited the theatre. "The curtain rose, and a strange world made its appearance. A large number of dancing-women set to dancing." This was probably the first time the Shah had seen a ballet. Wherever he went he was taken to the theatre, and the performance was usually of that kind which is intelligible without speech. Thus the Shah by the time he quitted Europe must have been a tolerable judge of ballet, and we observe that he places that of Vienna first. It is perhaps owing to the frequent mention of ballet in this book that the publisher has embellished it with an engraving from a Persian painting, which we recommend to theatrical managers in search of novelty. In the Chetr, or Fantail, posture in dancing, a young lady stands upon her hands, instead of her feet, and she wears a long and ample skirt. The Shah proceeded from Moscow to St. Petersburg, where he went several times to the theatres. He saw a play on the subject of Don Quixote, and seems to have known the story beforehand. He was well pleased with his reception by the Court and people, and admired the Russian troops, particularly the cavalry, "all handsome young men, with choice uniforms and powerful horses." From St. Petersburg he travelled by railway to Königsberg and Berlin. He had an eye everywhere both for fertility and beauty of scenery. He noticed that the populousness and cultivation of the land increased after he entered Prussia. "Human improvements of charming aspect came in sight, near and afar." Sometimes he tells his subjects, for whom he writes, that a valley or river which he saw reminds him of some place at home. Such passages give a favourable impression of the writer. He seems heartily desirous of his people's welfare. He praises the troops at Königsberg, and remarks that "the Prussian Kingdom is all soldiery." On the road to Berlin he saw very pretty gardens. "The jasmine of Shirwan, called by the Franks the lilac, was everywhere in flower." Many oxen were seen, resembling those of Mazandaran. At the Zoological Gardens of Berlin he first saw the African lion, "huge in bulk, terrible in appearance, with very thick black mane, large head, glaring eyes especially terrific, and graceful body resembling velvet." He went to Potsdam with all his suite, except one member of it, who remained in town, "as they have completed the telegraphic wires to Tehran, and he is talking with them." On the 7th of June he started by train for Cologne and Wiesbaden. He begins to feel that he is doing hard work. "Much as we wished to sleep, it was impossible. As soon as my eyes closed we would arrive at a station; talking and discussion would ensue; there was nothing for it but we must dress and hold ourselves in readiness until the governor of such a town, or the commander of such a fortress, should be introduced, and took himself off again." It is a comfort to find that mayors of English towns were not the only bores that the Shah encountered during his tour of Europe. On his way to Cologne he visited M. Krupp's iron-works. At Cologne he notices and describes a method of watering plants in the Botanical Garden. From Wiesbaden he went to Frankfurt-on-the-Main, where, after driving through the streets, he remarks that "the cities of Prangistan all resemble one another. When one has been seen, the arrangement, condition, and some of the others is in one's possession." He compares the climate of Baden-Baden to that of a

summer mountain-station at home. "It is a town in a valley having mountains all round, with meadows, woods, and green crops, exactly like the mountains of Kalafadit in Mazandaran." Pretty women and graceful ladies continually promenading made Baden-Baden "a fairy abode." He returned by rail to Biebrich, and descended the Rhine thence by steamer to Bonn, where he again took the rail for Spa. Crossing the frontier between Belgium and Germany he exclaims, "What a difference has the Almighty and Almighty Creator placed between the two nations and the two countries." In one moment, he saw, or thought he saw, a total change in people, language, religion, land, air, and water. At Spa, he remarks, on imperfect information as we venture to believe, that "the sun is never seen in these parts." He was much pleased with a religious procession which he saw there on Sunday. Charming little children nicely dressed "carried the portrait of Her Holiness Miryan, on whom be praise, and sang with a sweet melody, repeating litanies." The remarks of the Shah on Roman Catholic ceremonies contrast favourably with those which zealous Protestants, such for example as Mr. Spurgeon, are in the habit of making when they go abroad. At Spa he saw a conjurer, whose tricks he describes in detail. The attention bestowed by the Shah on European jugglers wherever he meets any would seem to show that the Eastern races are not so superior in this art as is generally assumed. From Spa he proceeded to Liège, Brussels, and Ostend, where "the functionaries delivered an excessive speech."

He embarked for England on the 18th of June. He was aware that the Channel was noted for storms and roughness. "But thanks be to God Most High, the sea was very calm, so that no one was incommoded." He was not so happy in his voyage to France. If he had been merely a gentleman travelling for pleasure he might have crossed from Dover to Calais, but the dignity either of the Shah or of the French nation required that he should embark at Portsmouth and land at Cherbourg, and in a voyage of eight hours he suffered in the usual manner. But he makes no complaint of this apparently unnecessary infliction beyond remarking that the sea passage need only have been an hour and a half. He quitted England and arrived in France on 5th July. He notices that the Tuileries and Hôtel de Ville had been destroyed by the Commune. "We were sadly grieved for this." At Versailles he displayed his bodily activity by scrambling up a mound to inspect a statue of Apollo. Marshal MacMahon had to be helped up by his suite. But he is careful to remark that this was no way derogatory to the Marshal's firmness and courage. He visited with great interest the tomb of Napoleon at the Invalides, and talked to a few veterans of Waterloo, Friedland, and Jena. It is pleasant to observe that, when the Shah thinks he has said a good thing, he enables his faithful subjects to enjoy the gratification of laughing at it. Thus he tells them how he—if we may venture to use such a word—"chaffed" the great Rothschild by proposing to him a plan by which at his own expense he might put an end to the dispersion of the Jews. The Shah saw "an admirable review" of eighty thousand men. "After all those defeats and ruin of the French, no idea had been entertained of such a collection and such discipline of their forces." Among the Shah's descriptions of Parisian scenes, the Jardin Mabille is not forgotten. He admired the lamps, avenues, cascades, and pavilion, and he remarked that "beautiful women of every description frequent the place." He evidently enjoyed his visit to the Circus, where the "extraordinary speckled horses" fully maintained the character of that establishment. He travelled from Paris to Geneva, and thence to Turin, Milan, Verona, Innsbruck, Linz, and Vienna. At Linz he remarks that the place possesses some most beautiful women. "Austria in point of beauty and engagingness is the queen of all lands." He frequently praises the scenery:—"The country (near Vienna) was most charming, the air pleasant, the fields green, and flowers of various kinds were noticed. There were many hares among the crops." At the Grand Opera House of Vienna they performed a play with dancing and music so beautiful "that the like had been witnessed in no place before." The description which follows might have been written for a newspaper, and if by any caprice of fortune the Shah should happen to lose his throne, he is clearly competent to earn a livelihood as a dramatic critic. He expresses warmly his sense of the kindnesses shown to him in Austria, and indeed throughout his tour. He travelled by rail from Vienna to Brindisi, and there embarked on the 14th of August for Constantinople. "In Firangistan," says he, "thanks be to God, all has passed safely and happily. God willing, the end of our tour will be equally pleasant and auspicious."

THE OLD CATHOLICS AND THEIR PANEGYRISTS.

THE Conference which was held at Bonn last September under Dr. Dollinger's presidency has naturally recalled the attention of outsiders to the progress and prospects of the Old Catholic movement. Of this of course the Old Catholics have no reason to complain; but in reading some of the comments, intended to be highly complimentary, which have recently appeared, one is inclined to suspect that they will be unpleasantly reminded by their panegyrists of the old proverb "Save me from my friends." A poet who prides himself on his depth of imaginative thought does not feel very grateful for the praise of a critic whose admiration is concentrated on the smoothness of his verse and the excellence of the typography, and it is rather irritating than otherwise to a

man who thinks himself a profound theologian to be eulogized by a friendly reviewer, not for his learning, but merely for the elegance of his style. But it is still less satisfactory to be praised for qualities which you not only do not regard as your chief excellences, but are anxious to disclaim. There is a story told of a late dignitary who had been preaching in a country parish what was no doubt an able sermon on the existence of God. One of his rustic hearers, with whom he entered into conversation afterwards, in the hope of finding that a due impression had been produced, ventured with much diffidence and many expressions of admiration of the beautiful discourse, to observe, "But after all, Sir, if you'll pardon my saying so, I can't help thinking as how there be a God." Now we are rather afraid that the Old Catholic leaders will listen to some of the laudations which have been lavished upon them of late with feelings not wholly dissimilar to Bishop Blomfield's on hearing the appreciative criticism of the farmer who had just sat under him. It is no doubt a valuable "giftie," as the old song says, to be able "to see ourselves as others see us," and they may perhaps be profited by a friendly reminder that some of their loudest advocates are lost in admiration at their rapid progress in unbelief. But this was not exactly the claim put forward by Dr. Dollinger and his adherents at Bonn on the sympathies of their Anglican and Oriental guests, nor would the latter, to judge from their attitude at the meeting, have been at all ready to respond to it. Two prominent members of the extreme left of the Broad Church party have, however, come forward since to offer their congratulations and advice on an assumption which is likely to be deprecated, if not resented as an insult. One of them was indeed present at the Conference, though he had not, we believe, been invited, and, when there, only enriched the discussion by a single question; the other was not there, and speaks rather slightly of "the ingenious manipulation of detailed differences," which was the chief business of the meeting.

Mr. John Hunt, who aired his views about the Bonn Conference in a long and tedious article in the *Contemporary Review* of last month, need not detain us long. His interest in the movement is almost avowedly of a purely exoteric kind. From a theological standpoint so very broad, or so very vague, as not to be easily distinguishable from mere deism, he looks with approving sympathy on a reaction against extreme dogmatism within the bosom of the Roman Catholic Church, which appears to him destined in the long run to issue in the disintegration of all dogmatic belief. The creeds which have come down from the ancient Church, we are expressly assured, must one and all be got rid of, and significant hints are thrown out that any formularies which may be supposed to take their place in the Church of the future must be purged of all taint of hierarchical or doctrinal traditions. As far as can be gathered from his very aggressive, but somewhat nebulous, lucubrations, the articles of faith accepted in the new dispensation will be chiefly of the negative, and its worship "chiefly of the silent sort." On the religious merits of this programme we need not dwell here. Mr. Hunt can of course speculate to his heart's content on the fascinating vision of a faith growing small by degrees and beautifully less, till it is lost in the luminous obscurity of a *nuveau* of painless obliteration. But it seems a little hard that Dr. Dollinger and Bishop Hinkens should be saddled with the responsibility of theories which nothing in their antecedents or their utterances would lead us to suppose to be other than most obnoxious to them. Certainly, if Mr. Hunt held a brief for the Court of Rome in its attack on those "notorious apostates," he could not have discharged his task more skillfully. Dean Stanley is a very different kind of writer from Mr. Hunt, but the preface he has just prefixed to Mme. Hyacinthe Loyson's translation of her husband's *Letters, Fragments, and Discourses on Catholic Reform*, betrays much the same anxiety to utilize the Old Catholic movement as a lever for controversial purposes in the pending struggle of parties in the Church of England. We may first, however, express some surprise at the appearance of the book at all, whether with or without a preface, at the present time and in its present form. The original was published more than two years ago, and although it is a mere stray collection of scattered and ephemeral papers on various religious subjects, extending over several years, and without any system or mutual coherence, it derived a certain interest from the character, eloquence, and rare courage of the author, who would hardly however be raised by any one except Dean Stanley to a more "conspicuous" post of leadership in the new movement than Dr. Dollinger. But, considering that one of the most remarkable letters in the volume is addressed to the General of the Barefooted Carmelites at Rome, and urges the "ardent desire" of the writer to resume his monastic habit and what his wife rather oddly renders "the life of Carmel," and that within a very few months of the publication of this earnest appeal, while still vehemently professing to remain a Catholic priest, he had deliberately violated both his priestly and monastic vows by marrying an American widow, one might have supposed he would best consult his own interests by allowing it to be forgotten as speedily as possible. The present republication in an English dress, and with Dean Stanley's extravagantly eulogistic *imprimatur* to these revelations of the great modern apostle of consubstantial felicity, does strike one as bordering more closely on the grotesque than on the sublime. Nor is our surprise diminished by the further discovery that the preface itself is also a republication, with some few modifications and additions, of a paper originally read at Sion College two or three years ago and then reproduced in the pages of the *Contemporary Review*. There are not many review articles, however interesting at the

moment, which deserve to be recalled from oblivion, and supposing the present essay to have been worth publishing at all, it was certainly no exception to the rule. We may add that the altered position of different parties within the Roman Catholic Church during the last two or three years makes it even less applicable than when it first appeared. One caution perhaps may not be superfluous for the more violent section of Liberal Catholics, who are warned that, if "parted from the general stream of historical and national tradition in the Catholic Church, they would probably become a bitter antagonistic sect, which, if it continued at all, would maintain itself in a stunted, one-sided, polemical position, hardly worth contending for." If Mr. Hunt's counsels were to be followed, this result would have every chance of being very speedily achieved.

Dean Stanley, as we have already implied, is throughout manifestly and almost avowedly making his defence of the Old Catholics a peg whereon to hang an apology for the Broad Church party in England; and that singular ingenuity in detecting points of resemblance, with an equally singular blindness in recognizing obvious distinctions, which is a marked characteristic of his writings, is conspicuously illustrated here. His first object is to insist that those who in any Church disagree with the dominant party or with any of its specific doctrines and institutions ought not to desert it, but to remain and labour to conform it to their own ideal. The only alternative open to educated men, we are told, is either for each of the disaffected members to found a new sect of his own, or for each to constitute a new sect in his own person by retiring into "complete individual isolation." A third course, which to ordinary readers might possibly have suggested itself as the most natural, that of secession to some other existing community, is just referred to in a note for the purpose of being set aside, because—and here in fact lies the essence of the Dean's contention—"in every mixed Church (*and all existing Churches are more or less mixed*) arise the same difficulties arising from partial disagreement as are involved in the case of the Old Catholics." And accordingly in all existing Churches the same solution of the difficulty is recommended. The struggle of the Old Catholics against the Ultramontanes is virtually the same with that maintained "against what may be called the Ultramontanes in each of the Churches of Christendom, Catholic or Protestant, Conforming or Nonconforming." And the analogy is exemplified at length in the case of the English Latitudinarians; of John Wesley, when he said he "varied from the Church of England, but would never leave it"; of the Liberal Protestants in the French Huguenot Church; of John Bunyan, Robert Hall, and Dr. Davidson among Dissenters, and various Free-thinking members of the three Presbyterian Churches of Scotland. In all these cases "the dominant party" are of course equally anxious to disclaim the society of their unwelcome comrades, who however are supposed to reply that they value the advantages of their position "not only temporal but spiritual," and also consider "their existence within the body an advantage to it," if indeed they do not claim to be its truest representatives. Thus, for instance, we are assured that the French Liberal Protestants best represent the "general spirit" of their communion, as also "the English Latitudinarians certainly approach more nearly to the spirit of the first Reformers, like Erasmus and Colet, Tyndale and Cranmer, and also to the Church of Tillotson, Butler, and Paley . . . than do their opponents." The names we have taken the liberty of italicizing sufficiently indicate the Dean's odd way of interpreting history on *à priori* principles. Without discussing here his view of the French Protestant Church, which is in violent opposition to the late M. Guizot's, there is something amazing in the notion of "the first Reformers," either in England or on the Continent, being as a rule tolerant of "Latitudinarianism." There were no doubt a few exceptions, and Erasmus, who was much more of a classicist than a Reformer, stands prominent among them; but it may safely be affirmed that neither Colet, Cranmer, nor Butler would have had much patience with the theology of the Dean of Westminster. Nor is he altogether happy when he comes to expound the particular claim, as he understands it, of the Old Catholics. That they represent more than their opponents the spirit of the ancient Gallicans and Port-Royalists, and of "the silent majority of educated Roman Catholics throughout Europe," may be true enough. But their apologist puts a strange confusion of ideas into their mouths when he makes them say that they do not differ more widely from the received standard of Roman Catholic orthodoxy than those who offer defiance to the decrees which forbid them to have money in the bank, to have intercourse with heretics, to possess and read books placed on the Index, and command them to believe in the Ptolemaic system, the unerring authority of the Vulgate, and the reality of witchcraft. Some of the Papal decrees here referred to have been justly cited as historical objections to the new dogma of infallibility; but, in the connexion here intended, all or nearly all of them are purely irrelevant. The decrees about usury and astronomy, for instance, have been long since rescinded or withdrawn; the rule against intercourse with heretics was repealed four centuries ago by the Council of Constance; and the authority of the Index is only held binding in certain countries, of which England is not one.

We are far from meaning to imply that the Old Catholics cannot make out a good case for themselves; but it may be fairly doubted whether they would be very ready to accept Dr. Stanley as their spokesman. Professor Bluntchli, who is here forced into the most intimate alliance with them, is a professed deist, and he

carefully guarded himself, in other parts of the speech from which the Dean has made a quotation, against making himself in any way responsible for their beliefs, or them for his own; nor is there anything to show that the absolute and persecuting Erastianism of the Swiss Old Catholics, which kindles Dr. Stanley's enthusiastic admiration, is shared by their brethren in Germany. Dr. Döllinger, if we are not mistaken, has especially disclaimed such a view. There is moreover a question which continually recurs to the reader of this ingenious but slightly sophistical argument, and to which it may at least be said that no answer is provided. "No doubt," the author admits, "there is a limit to such variations, and compromise may go too far." But, instead of offering any solution of this rather serious difficulty, he proceeds at once to add a comment which will appear to many members of all Christian Churches to carry compromise a very long way indeed. "The fact remains," we are informed, that "Christianity itself, as it now exists, is a compromise between the religion of the first and of the nineteenth century, and it is the wisdom and policy alike of individuals and of communities to blend and to bear with the conflicting elements as best they can." This statement, like many others in the preface, is sufficiently vague to be susceptible of more than one interpretation; but in its natural and obvious sense it must mean that Christianity as taught by Christ and the Apostles has in the course of eighteen centuries been largely dilated and modified by the admixture of heterogeneous elements, and that the hybrid compound, which remains as the result of the process, is the proper religion for an educated man in the present day. Into the question of fact we need not enter; the author is inculcating what he holds to be a vital principle. And to his argument there is one sufficient and self-evident reply. Christianity must be one or other of two things, and cannot possibly be both together. It is either a lofty ethical system propounded by a great moral teacher—perhaps, as the late Mr. Mill seems to have thought, by the greatest moral teacher the world has ever seen—or it is, as its Founder and His immediate emissaries unquestionably maintained, a revelation from heaven. If we adopt the latter alternative, there is clearly no room for the sort of compromise advocated here. If we prefer the former, it is no less abundantly clear that "all existing Churches" are based on a radically false assumption, and it would seem to be the only straightforward course for those who have attained that conviction, not only to "desert," but to denounce them, rather than to engage in the hopeless and unprofitable task of labouring to torture formularies, usages, and traditions unmistakably moulded on one perfectly intelligible theory into accordance with another theory equally intelligible but fundamentally opposed to it. To pursue the latter "policy" is either to smother serious beliefs, or to waste valuable time in twisting ropes of sand.

CATTLE SHOWS.

CATTLE shows are popular in England, and it is not remarkable that they should be well supported when it is considered that probably our people eat more meat per head than is consumed by the people of any other country. Whatever seeds of decay may be discovered by acute critics in other institutions, the critic is yet to be found who can discover the grounds for predicting the downfall of cattle shows. Given a large population gathered together in a comparatively small area, or given a place easily accessible by railway, let the readiness to award a large sum in prizes to exhibitors be advertised, and it is certain that there will be plenty of candidates to contend for the premiums offered, and, what is more to the purpose of the promoters of the show, there will be a public willing and ready to pour enough shillings into the treasury to repay, not only the amount of all the prizes that may have been offered, but also all the expenses, and a good profit to boot for those who have entered upon the adventure. All that is necessary is to make sure that there is a sufficiently large population within easy reach of the showyard. It is on precisely the same principle that promoters of race-meetings act when their financial success depends upon the "gate money." And probably the bulk of the attendants at race meetings and at cattle shows, excepting in each case what we may call the professional element, is drawn from the same class. It is easy to understand in the case of races that the temptation of a day's outing, the innate love of horses which possesses most Englishmen, and the excitement of seeing the actual struggle for victory, to say nothing of the gambling infatuation which appears to have laid hold of all classes, are sufficient inducements to extract shillings from the pockets of the masses. But it is not so easy to discover why people flock to cattle shows. Every man who goes to a race believes that he has at any rate some knowledge of the "events" that are coming off, and there is always patent to every observer the more or less obvious result that one horse has been able to pass another horse by so many inches or yards after a course of greater or less length. The comparative merits of the animals are decided by the result, and the process by which the result is determined is picturesque and exciting. In cattle shows, however, there are none of these allurements, and the curious thing is that so many people who are utterly without interest in the business are found to pay to see what is at its best but a very dull sight, not nearly so gay or interesting as the parade in a saddling paddock. In the abstract it would seem to be a very poor amusement for people to walk up and down among long rows of animals when the greater part of the good folk

have not knowledge enough of the creatures to distinguish one breed from another. There is, however, a glorious uncertainty in cattle shows as well as in racing, or in the decisions of law courts, or in other popular amusements. The opinions of the skilled persons to whom lot it falls to select the best animals rarely receive the unanimous assent of experts who are not called upon to act as official judges. In fact it would appear that among connoisseurs the chief business of a cattle show is to judge the unfortunate judges, and it is an amusement from which those who join in it appear to derive no small amount of satisfaction. It is only, however, to the few that the fun of "judge baiting" is possible, and we are still left to wonder wherein the million find the attraction that leads them to the show. It would be a curious inquiry to ask what proportion of spectators at a cattle show could actually point out in the living animal the position of the juicy steak of which no doubt all of them would be excellent judges when it appeared on their dinner-tables. Are there many who could accurately distinguish the position of the rump, the silver-side, the sirloin, the ribs, or who could select the pen of sheep that would afford the most tender chop, with nicely balanced fat and lean, or the most palatable haunch? And yet it is only those to whom these questions afford no puzzle who can really understand the merits of the animals they come to see. Perhaps there is a general, though ill-defined, sentiment that it is a good and a right thing to gaze upon and admire the best specimens of the almost sacred beast which gives the national roast beef, and that the spectators by joining in this worship do in some indefinite way lend their aid to keep in its place one of the pillars of the constitution; though after all we believe that people go to cattle shows just for the same reason that they go to races—namely, simply and purely for the sake of a holiday.

It is not difficult to discover the reasons which induce men to become exhibitors. They may be easily classified. The dukes and lords and squires, following the example set by royalty, may be supposed to be influenced by public-spirited motives, and to be acting for the general advancement of agriculture, when they show what can be done in fattening animals. Their frequent success in the lists is due to the fact that they either possess flocks and herds of strains of blood which have been selected without question of cost, or that they purchase from time to time animals which are almost certain to prove winners; and most probably their honours are purchased dearly. Then appear the breeders of fancy stock, whose interest is not confined to the success of the animals they exhibit; they use the shows as an advertisement of their names as owners and producers for sale of animals of high class. In a recently issued circular of one of the great cattle salesmen, it is stated that there is scarcely a civilized country of the world that has not sought to improve its herds by mixing with them the blood of England's best tribes. It, therefore, pays these breeders to spare no expense in forcing one or two animals into form for exhibition at fat cattle shows, as, apart from the premiums they may obtain, the success of their animals establishes their reputation and enhances many fold the price of the large number they produce for breeding purposes. These men are for the most part exceptionally skilful and observant, and it is said of the most skilful among them that they are able to select almost a few hours after their birth the specimens destined to be the glory of the show-yard, on which thenceforth the most unremitting care and the most enticing foods are lavished. And, lastly, we come to those farmers who, relying on their own judgment, or on that of their neighbours, or on their success at a local show, believe they possess an animal worthy to be a prize winner at the great centres, and put it in training accordingly. Rarely, however, does success repay them for their cost and trouble, for the experience of the professional exhibitors of the first two classes is like the experience of the first-rate professional rider when pitted against the "gentleman" jockey. The amateur has no chance; although he may have an equal or slightly better animal, the odds are against him. If he wins anything but the largest prizes he is scarcely repaid for the enormous extra cost of feed and the expense of sending to the show, while, if he loses, he finds these expenses run up to an uncomfortably large amount; and in running the risk he stakes a very heavy sum in proportion to what there is any chance of his winning. To exhibit occasionally, and merely for the sake of winning the prize money, is not a paying game.

It cannot be for a moment doubted that the encouragement given by cattle shows to the improvement of the various breeds of cattle has produced important and excellent results. But doubts begin to be expressed pretty freely as to whether high breeding has not already been cultivated to excess. It appears to be admitted on all hands that shorthorn cattle, for instance, have decreased in size, while it seems also certain that the fecundity of these highly-bred animals is not so great as it was; for it is said that certain tribes have become celebrated for the barrenness of their females, while at the same time a delicacy of constitution has been developed which unfits them for "roughing it," and requires luxurious arrangements to preserve them in health. As in our racehorses we have, according to some authorities, sacrificed stoutness of constitution and capacity of endurance over long courses for the sake of obtaining high speed over a short distance, so in our cattle the desire for fineness of bone and rapid development of meat has brought into fashion animals which have lost many of the valuable properties of their ancestors. Such breeds cannot exist when subjected to the rough weather which prevails on the exposed hill-sides and moors which are so valuable as breeding-grounds and nurseries.

for stock; and perhaps it is for this reason that Ireland, which is prolific in cattle, reared without shelter, fails to send us anything which can obtain a place in our exhibitions. Without doubt Ireland possesses, and has on show this week in Dublin, first-class cattle; but these are bred, sheltered, and fed under the same conditions as those to be seen at Islington. And the consumers have something to say also in the matter, as there is beef and beef. They prefer, and justly prefer, the meat of the Devon or the Scot, whose young days are spent in cropping the scanty herbage of the moor or mountain, because the meat has more flavour than that of the rapidly-fed stall-fed ox, who has been crammed with corn and linseed-cake from his calfhood. So that even if it be true, as the breeders of the delicate animal contend, that their meat can be produced more economically, because more rapidly, than that of other races, let them remember that in losing stamina they restrict the area upon which the beasts can be reared, and that we want flavour in our meat even if we have to pay a price for it. For instance, tourists find mutton tolerably abundant in most European countries; but let them recall the sentiment of thankfulness and delight which arises on meeting a joint of our own Southdown on a return from their foreign trip. We look for quality as well as for quantity.

The Smithfield Club Show has experienced a great falling off in the number of specimens exhibited, though, from the uniform good quality, it is evident that the great shows of the North and Midland districts, notwithstanding the liberal prizes offered, have not been able to tempt owners to give up the chance of winning prizes, if of less amount, yet held in greater estimation, at the London show. At Manchester, where a show on the largest scale has been set on foot this year, the judges thought proper to withhold first prizes for want of merit in some of the classes, and it seems as if Manchester were almost out of reach of the rearers of Devon stock, so few of the class were there. The Scots and short-horns, however, had a preliminary contest there before the Birmingham meeting with its rich prizes; and it is to be regretted that the managers of the London show do not feel it safe to open their doors to these country winners. Birmingham, however, had not a collection coming up to the usual standard of quality, and, whether from the falling off in the prosperity of the staple trades of the district, and the consequent reduction in the wages of the iron and coal workers, or, as has been suggested, from fear of contracting the disease reported to be prevalent in the town, the number of people attending the show was much less than last year. As we have already said, the animals presented at these exhibitions are quite exceptional. Their appearance affords no indication of the condition or quality of the general supply of the season to be found in the markets, or we should have to note what has been the characteristic of the stock offered for sale—namely, its immaturity. The drought of the summer, and the short yield of hay, coupled with a very poor crop of roots, left farmers with a very poor provision for their herds. And the price of all imported feeding material being exceptionally high, it became their interest to get rid of their animals as soon as they could be brought into decently marketable order. Hence the numbers offering have been large—large enough indeed to bring down the price of inferior meat; while, on the other hand, good meat has been so scarce that prices are little lower than they were a year ago. And the worst of the matter is that the slaughtering of the animals now at two-thirds or three-fourths of the weight which they would have attained if kept to the age at which usually they come to market reduces the stock on hand, and will surely at some no distant period cause short supplies and an enhancement of price, unless there be, on account of a general reduction of wages, a diminution in the demand.

REVIEWS.

SOCIAL PRESSURE.*

THE long series of discussions by "Friends in Council" still sustains its interest. The professed subject of the present volume is the disadvantage of the assemblage of a vast population in great towns, and especially in London. There is little use in preaching to builders, to speculators in building land, or to their customers who crowd to occupy suburban houses as fast as they are built. The kind of society which is still to be found in France and in other parts of the Continent has disappeared from English country towns; and for those who are not tied by business to any special place of residence, London has many advantages as compared with a provincial town. Bath, Cheltenham, Brighton, and a few other outlying colonies relieve the metropolis of a certain number of possible residents; but the majority of families of independent means gravitate more and more constantly to London. The great and steady increase of commerce is another cause of the insatiable demand for houses. The City is more than at any former time the financial centre of the world, and the hundreds of thousands who throng its streets and offices in the daytime reside within a circuit of twenty miles round the Mansion House. It follows that, as the chief "Friend in Council" complains, it is difficult for a Londoner to take a country walk. Those who are sensitive to differences of air would perhaps breathe more pleasantly in a rural solitude; but, on the whole, notwith-

standing the crowds which might be supposed to pollute the atmosphere, the better parts of London are remarkably healthy. The weekly or annual returns of mortality, which contrast favourably with those of many other towns, represent the condition of Clerkenwell, of Seven Dials, and of Bermondsey, as well as of South Kensington and of Tyburnia. If the sanitary condition of the West End were separately ascertained, it would probably be found almost as good as that of average country houses, and much better than that of ordinary villages. Sanitary theorists contrast the water of the Thames with that of Loch Katrine, yet the mortality of London is in the proportion of 12 to 17 as compared with the mortality of Glasgow. If the inhabitants of the metropolis ought to die rapidly, they unaccountably neglect their duty.

Mr. Milverton, who, notwithstanding his strictly anonymous character, describes himself as drawing Orders in Council, has too much good sense to suppose that any remonstrance will check the apparently endless expansion of London. His suggestions for the mitigation of unavoidable evils are that wealthy benefactors should provide open spaces, and that covered walks or halls should be erected for purposes of shelter. The few places of the kind which are to be found in London are frequented by the least respectable part of the community; and some years ago the Colonnade in the Quadrant was removed at the instance of the inhabitants, because it attracted undesirable visitors. The most objectionable form of "Social Pressure" in London, not mentioned in Mr. Milverton's essay, is contributed by that coarse and brutal part of the population of which the cant name of "roughs" seems likely to become an English word. The strictest police supervision would be needed to maintain order, decency, and safety in Mr. Milverton's convenient galleries and corridors. Of the expediency of preventing as far as possible the existence of noxious trades and other nuisances in London there can be but one opinion. Mr. Milverton unnecessarily denounces the objection which he supposes to be urged against sanitary regulations on grounds of political economy. No reasonable economist desires that a pig-keeper or an owner of a slaughter-house should be allowed at his pleasure to poison or annoy his neighbours in the centre of a great town by his operations, however lucrative. It is but an idle reproof to tell a tailor that the body is more than raiment. The answer is, that clothes are nevertheless useful, if not necessary; nor are the accumulation and distribution of wealth and the processes of buying and selling, which are the subjects of political economy, insignificant parts of human life and conduct. The economist would advise legislators neither to protect domestic industry in pigs for the sake of pork butchers, nor to teach them how they should feed or kill their pigs so as to obtain the greatest profit. The question of the places where pig-killers should be allowed to exercise their industry would be relegated by political economy to the domain of sanitary administration.

While the author of *Friends in Council* always chooses a principal topic for discussion, he fortunately allows conversation to diverge by a natural process into remote and diverse channels. There is much to say about great cities; but it is scarcely worth while to say it, because, whatever may be said, cities are always becoming greater and greater. Mr. Milverton, as might be expected, takes the opportunity of advocating paternal government, and of reiterating his favourite recommendation that a permanent element should be introduced into the highest administrative ranks. It is perfectly true that crowded communities require increased interference on the part of Government for the protection of every man against the encroachments and the negligence of his neighbours. The builder of a cottage or farmhouse on a Welsh hill-side may consult his own fancy as long as he can keep out of the reach of sanitary inspectors; but Corporations and Local Boards properly claim a voice in all building arrangements within their jurisdiction; and many proprietors find with surprise that they cannot build in their own parks and pleasure grounds without official interference. The elevation of the rank of permanent Civil Servants might possibly in some cases produce public benefit; but it involves a constitutional difficulty. One of the speakers in the dialogues which occupy the bulk of the present volume asserts that the restriction of high offices to members of Parliament is as absurd and indefensible as a rule that Ministers should be chosen only among those whose noses were of a certain shape. The analogy is erroneous in itself, and it belongs to a class of fallacies into which political critics and reformers are prone to fall. It is always rash to compare any institution to an imaginary absurdity. The difference is that an existing paradox has always a cause, and therefore an excuse which may sometimes amount to a justification, while a caricature is for the most part an inexplicable anomaly. A permanent Under-Secretary or Chief Clerk may often be as able a man as his Parliamentary chief, and he will certainly know more of the details of official business. His deficiency would consist in the want of that power which is given to a Minister by his position as a member of the governing Committee of the Parliamentary majority. In former times nobles and prelates held the great offices of State, not because they necessarily were the most competent administrators, but because their rank made them the most powerful rulers. Even in the present day the Commission of the Peace is in theory, and to some extent in practice, confined to the dominant class in rural districts. It is possible that the change which has been consistently recommended since the remote commencement of the discussions of *Friends in Council* may be hereafter adopted, but the transfer of authority from politicians to clerks will have been a constitutional revolution. In practice it

* *Social Pressure*. By the Author of "Friends in Council." London: Daldy, Isbister, & Co.

has been found that the chief party leaders are among the ablest men of their time. Sir Robert Peel, Mr. Gladstone, and Lord Palmerston would have had no reason to fear competition with the most brilliant members of the Civil Service. In their conduct of business Under-Secretaries have placed their experience at the service of their superiors, not the less willingly because there could be no question of rivalry or jealousy between the two sections of administrators. A wise Minister devolves as large a part as possible of his duties on subordinates, who will be zealous in his service in proportion to his confidence and their own responsibility. It is true that their services are not rewarded in fortune or in fame; but the sense of duty, strengthened by official tradition, has hitherto been sufficient for the purpose. When the Duke of York or General Monk commanded the fleets of Charles II. the professional seamen who obeyed their orders were probably satisfied when they secured the approbation of their superiors. It is true that the precedent may be quoted in favour of combining technical knowledge with the rank which has since been exclusively bestowed on regularly trained naval officers. An absolute monarch may at his pleasure employ Ministers who understand the business of their respective offices, while they derive their power exclusively from the favour of the Crown. In England a sovereign Parliament reposes its confidence exclusively in its own members. Mr. Milverton's hierarchy of clerks might construct admirable measures, legislative or administrative, but they would find great difficulty in passing Acts of Parliament.

An essay and conversation on "Looking back on Life" is to some tastes more attractive than disquisitions on towns or on public offices. The supposed author of the essay on old or mature age is a thoughtful and accurate observer. It would be hard if the loss of the numerous advantages which belong to youth were not attended by some kind of compensation. It is certain that men become more tolerant as they grow older, and that, even if it cannot be said that they think less of themselves, they learn to conceal a selfishness which is probably diminished by deliberate suppression. The shyness which troubles so many of the young must be excessive and inveterate if it is not relieved by long contact with the world. Every moderately observant person finds, as he advances in life, that his neighbours are thinking less of him than of themselves, that they soon forget his blunders, and that they have probably never noticed the unbecomingness which have seemed to himself overwhelming. He also learns that his happiness is not dependent on the superficial opinions which may be formed of his own conduct and character by indifferent observers. If only his friends and enemies are content to be courteous to his face, he will consider that they are welcome to censure him behind his back. His own growing tolerance is probably reflected in the dispositions of his associates, and he is willing to incur with amused patience the severer judgment of inexperienced youth. In tolerable prosperity men become less sensitive and more good-humoured as they grow older, and above all they are less inclined to proselytism. To an eager and sincere young logician it is unbearable that the arguments which convince himself should neither be refuted nor admitted by his friends. A wise man in after years knows that arguments tend but rarely and indirectly to affect opinion. Only fussy dispositions and second-rate intellects retain their polemical propensities in riper age. According to Mr. Milverton, "Unless hindered by physical circumstances, such as ill health, loss of hearing, or loss of sight, the capacity for social enjoyment with many persons goes on steadily increasing." The art of conversation is seldom a juvenile accomplishment, and good talk, though it is rarely enjoyed, is one of the greatest pleasures of human life.

One of the numerous merits of the series of which the present volume forms the latest instalment is that the imaginary conversations of which it chiefly consists approximate to real talk of the better kind. The unavoidable necessity of assigning a fixed character to each of the interlocutors diminishes in some degree the natural flow of unpremeditated discourse. On the other hand, the happy tendency of the author to diverge from the subject which he had intended to discuss makes the speeches of his characters more spontaneous, and therefore more interesting. Literary dialogues always tend to degenerate into the conventional type, according to which, as in the works of Dickens, every declaimer or buffoon is recognized by his appropriate cant-word or "tag." Mr. Milverton and his friends are not exempt from this defect; but on the whole they represent a natural flow and probable diversity of thought. One of the causes which make the composition of imaginary conversations difficult is that literary works are the result of previous meditation, while all good talk is absolutely extemporaneous. No conscientious artist in this department utters a premeditated aphorism or jest without a transient pang of compunction as for the perpetration of a solecism or a fraud. The repartee ought always to be the real as well as the apparent result of the remark to which it is a reply; and in that large part of conversation which has nothing to do with the exchange of epigrams, the successive results of the serious or humorous theory under discussion ought to evolve themselves as unexpectedly to the speaker as to the hearer. Young aspirants to social success will find great advantage in adopting the rule of talking as little as possible about persons, and preferring the discussion of things. Gossip and scandal are so attractive that they are certain to obtain their due share of notice in conversation. Even with the aid of sound doctrine they can only hope to approach per-

fection or eminence after long experience of life; and in the meantime they must console themselves as well as they can by the knowledge that good looks and animal spirits are to an unintellectual race of men and women by many degrees more attractive than the wisest or wittiest conversation. For the most part, the mitigating circumstances which compensate for the disabilities of youth are perhaps regarded as proofs of superiority; nor indeed is it possible for those who belong to an older generation to repress a feeling of gratitude for the affability with which they are sometimes treated by the young. The representatives of the golden age which is always in the past seem, and perhaps are, above the level of the prosaic present. Those who enjoy good conversation, and are capable of contributing their share, are fortunate if they have occasional opportunities of the only social pleasure which survives early middle age. A single good talker is as useless by himself as a single battledore. It is in the exchange of thought, of humour, and of wit that real conversation consists. It is too much to expect that in any single company a large number of pleasant talkers should be found, but the brilliancy and interest of conversation improves with the number of those who take part in it, as the Attic tragedy when it expanded beyond the two interlocutors of Theopis. A judicious critic once complained that the *School for Scandal* was unnatural because it was impossible that so many witty persons should be found in one social circle. It is too much to hope that Joseph Surface, Sir Benjamin Backbite, and Mrs. Candour should meet in real life for the delight of an appreciative audience; but sometimes more amiable, if less sparkling, substitutes may take their place. Mr. Milverton complains that critics sometimes make remarks of their own instead of strictly confining themselves to the text. It is too true that the charge is often well founded, but the author of a book which becomes the subject of digressive remarks may claim credit for his power of suggestion. The essays and conversations which bear the title of *Social Pressure* are themselves occasionally desultory.

TWO BOOKS ON POLITICAL ECONOMY.*

THE two little books before us have certain points in common. Both of them have the merit of shortness, and of what we suppose may be called orthodox economical views. General Marriott and Mrs. Fawcett are equally believers in the main articles of the faith delivered to the disciples of Ricardo, Malthus, Mr. Mill, and Professor Cairnes. We will not at present raise the question how far that system of doctrine deserves to be dignified with the name of science. No one who has studied it will deny that it has an admirable logical coherency, though it may be disputed how far its fundamental postulates correspond to the actual facts of human society. At any rate it presents a series of propositions capable of definite statement and of what appears to be something like mathematical demonstration. As such, it is a highly convenient system for the purposes of competitive examination. A paper can be set in Political Economy as easily as in Euclid; and we presume that both the General and the lady have an eye not only to the general benefit of their species, but to the wants of the growing class which undergoes the torture of a periodical overhauling of its little stock of knowledge. The two writers, however, take different modes of approaching the youthful intellect. General Marriott has endeavoured to state the fundamental axioms of the science as clearly and briefly as possible, and to connect them by the most rigid proofs of its conclusions stated in the most concise form. He has tried in a short volume to give us the pith and marrow of a doctrine which has been expounded into much more voluminous treatises. The success of such a book can only be determined by experiment. We are happy to express our own opinion indeed that General Marriott is thoroughly sound in his logic and clear in his statements. If we were to criticize, we should be disposed to say that he has given rather too much space to the thankless task of laying down accurate definitions, and that he might have given a rather larger allowance of concrete illustrations. Political economists are very fond of discussing at great length the correct definitions of productive and unproductive labour, of fixed and circulating capital, and so forth; and are very apt to forget their definitions entirely as soon as they get beyond the first chapter. Of course it is desirable that language should be used accurately, and a certain amount of pains must be bestowed upon definitions. But when too much accuracy is affected, the student is rather apt to forget that the study is useless unless it is applicable to the social conditions of the time, and he should be at least carefully warned that things refuse to distribute themselves into classes so neatly marked off from each other as would be convenient for abstract theorists. However, the fault, if it be a fault, is a slight one; and we are prepared to believe that General Marriott's *précis* of the science will be found very useful when the dry bones of its demonstration are clothed with a due amount of concrete illustration. In short, it seems to us to be a clear and convenient handbook, and we hope that it will receive due attention from those whose duty it is to indoctrinate the young student.

* *A Grammar of Political Economy.* By Major-General W. F. Marriott, C.S.I. London: Henry S. King & Co. 1874.
Tales in Political Economy. By Millicent Garrett Fawcett. London: Macmillan & Co.

Mrs. Fawcett has already composed a useful little book of a similar kind for the use of beginners. From her present undertaking, however, we are disposed to infer that she has found that the student is occasionally recalcitrant. There are, in fact, persons of indolent or sentimental minds who are apt to whisper that political economy is at best a "dismal science." They are actually bored by demonstrations of the law of rent or the equation of international demand and supply. Mrs. Fawcett, therefore, has condescended to meet this weakness. She inserts a "word of apology" to Miss Martineau for adopting the idea popularized a generation ago by that admirable writer. This idea is defined by Mrs. Fawcett to be the wrapping up of the powder of political economy in the raspberry jam of a story. Now it must be confessed that this scheme, however inviting, has its difficulties. We remember certain deceptions practised upon us in our childish days from the effects of which we have not quite recovered. For many years the delightful substitute for butter at breakfast—if we rightly remember the beautiful language of certain wrappers on pots of marmalade—became suspect to us; because its sweetness was powerfully associated in our minds with the friction of a hard gritty substance upon our teeth. There is, in fact, a danger which it requires all the skill of a Miss Martineau to surmount successfully. Either the powder is so slightly covered that the jam becomes a mere repulsive sham, or it is covered so effectually that it produces no sanitary effects. We can most conscientiously say that Mrs. Fawcett has not fallen into the latter fault. She has been very sparing of the jam, so sparing that we are induced to think that it might almost as well have been left out altogether. The tales are three in number. The first concerns a certain race called the Srimats—a name which may possibly conceal some meaning too skilfully concealed for our ingenuity—who have adopted a plan suggested, if we remember rightly, by Bastiat. They have, in fact, carried the protective spirit so far as to forbid the use of light with a view to encouraging the production of palm-oil. They are confuted, but not convinced, by a certain Captain Adam, who is throughout the book the representative of a sound political economy. After some description of their follies, we have the plain undiluted moral. "The story," we are told, "is an illustration of the fact that when you have once got protection, it is impossible to get rid of it without injuring the people who have invested their capital and labour in the protected industry." And upon this text, doubtless a very sound one, Mrs. Fawcett dilates very forcibly for the rest of the chapter.

The other two tales are substantially one; being an account of certain shipwrecked sailors upon a desert island, who gradually learn by experience the advantages of division of labour, of saving capital, of substituting a currency for mere barter, and so on. They succeed so well, though they make some very gross blunders, that their dwelling-place appears in the last story as Isle Pleasant. Observation of the laws of political economy has made them rich and prosperous, and they are able to perceive the blessings of Free-trade. Happy—that seems to be the most obvious moral—is the land where the inhabitants are thoroughly imbued with the principles of Mr. Mill, and accept a treatise on Political Economy for their Bible. Possibly a Socialist or so might object that a company of people thrown together upon a desert island might find a *régime* of unrestricted competition not altogether suitable to their circumstances. A politician might ask how discipline was maintained; or a missionary, what kind of religious principles enabled them to bear their hardships. But such questions would be irrelevant. The sailors are mere lay figures set to illustrate certain theories, and of course they are quite right to act as though the only problems in this troublesome world were those which can be answered by a Professor of Political Economy. The effect, however, of this method of story-telling is to make the actors slightly uninteresting. We cannot say, for example, that we are much attracted by a story the headings of which run as follows:—"Division of labour—Exchange—Are luxurious expenditure and waste good for trade?—Demand for commodities not a demand for labour—Demand and supply," and so on. Nay, the fact that, instead of the purely colourless labourer or capitalist with whom we are familiar in more formal treatises, we have a concrete Jack Collins and Green the carpenter, does not effectually delude us into much interest in their adventures. It is like looking on at a dance when we discover that the performers, instead of enjoying themselves or exhibiting their agility, are really placing themselves so as to represent the A, B, C of a mathematical diagram. Their performances are not very exciting, and we feel that we could without much regret dispense with their presence altogether, and, in short, take our powder without the jam.

We admit, however, that we are not quite competent judges. Mrs. Fawcett has probably some experience of the difficulties of beginners; and it may be that a sucking political economist is so innocent in disposition as to be allured by this simple machinery. A gudgeon, we know, will take a hook which we should have thought inadequately concealed even for his limited powers of reasoning. The fishers of men who seek to inveigle the youthful mind into swallowing rigid economical formulas know what kind of bait is most attractive to their prey, and we hope that Mrs. Fawcett's well-meant efforts may be successful. Meanwhile we must confess that to us the book is rather a treatise than a story; and we need not apologize for noticing one or two passages in which Mrs. Fawcett's language seems to be not strictly accurate. We may observe, for example, that a hundred guineas for eight

weeks, excluding Sundays, represents more than two guineas a day, instead of more than one. This is a mere arithmetical slip. Another statement is of more importance. The luxurious man has to learn by sad experience "that the only demand for labour is that which is really to supply commodities for the labourer in exchange for those which his toil produces." This strikes us as at least open to misconstruction; though it is meant to express the very sound doctrine that demand for labour is not demand for commodities. It would imply, for example, that the sale of tobacco to a peasant proprietor in exchange for his corn was equivalent to a demand for labour. This, we take it, is not the sound doctrine; Mrs. Fawcett should rather have said that the only demand for labour is the accumulation of the materials which support the labourer during his productive exertions. The difference is not between the demand for commodities which the labourer has produced and those which a merchant has to sell, but between the commodities exchanged for those already produced and those devoted to increasing production. Mrs. Fawcett understands the principle, but we think that her language is here rather careless. Nor, again, should it be said without some qualification that trade is "not reciprocal" when one country sends commodities and is paid by the other in money. The trade between England and Australia might be a reciprocation of advantages, though England received only gold in exchange for cloth. Bullion, in short, is a commodity, and it may be an advantage to a country to have more of it, though of course its value as a circulating medium sinks in proportion to the increased supply. The doctrine, in short, is stated rather too roundly, though the general principle is sound enough. As a rule, however, Mrs. Fawcett appears to us to be satisfactory in her expositions, though we cannot say that to our taste the economic doctrine is made more attractive by the thin veil of fiction.

LANDSCAPES, CHURCHES, AND MORALITIES.*

IT was Lord Palmerston, we believe, who suspected that all Shakspeare's plays were written by Bacon. It seemed so unlikely that one age and one small country should have seen two men of such vast genius, that he found it easier to imagine that it was one man who had done the work which had been commonly assigned to two, than that two should have been found capable of dividing the work between them. In like manner we have our suspicions that all the works that have been brought out under the name of A. K. H. B. are really the productions of Mr. Tupper. For it seems, indeed, even more unlikely that two men can have been found at one time capable of writing *The Recreations of a Country Parson* and *Proverbial Philosophy*, than of writing *Hamlet*, for instance, and the *Novum Organum*. There may be some, perhaps, who will raise a physical objection to our theory; they will say that, though it is quite possible to conceive of a brain that could compose with the rapidity required, yet it is scarcely possible to imagine that any one man has a hand that could bear the fatigue of writing down all that the Philosopher and the Country Parson have together composed. We might meet the difficulty with one of two suppositions. The writer, whether we call him Martin Farquhar Tupper or A. K. H. B.—for, as we have said, we suppose that they are one and the same—keeps perhaps a couple of shorthand writers. One of them he doubtless seats on what we may call the prose side of his study, and the other on the poetical. Some such arrangement as this must certainly be required, so that, as the double dictation goes on, there may be no doubt as to when poetry is being dictated and when prose. Or, if we prefer it, we may conceive that, like a great painter, he keeps round him a school of young philosophers and young poets. He himself sketches a subject, and bids each student go on moralizing at it till the bell rings for lunch. For instance, we can imagine that the great moralist has come in from a walk, and that he has seen, as indeed the author of the book before us tells us he one day did see, many cabmen in the street eagerly holding up their whips, surmising that he was looking for a cab, and each desirous that he should employ him. All he has to do is to turn to one of his youthful philosophers, and to dictate to him the first sentence of an essay as follows:—"As the philosophic thinker walks that street, and sees the eager whips held up, the reflection will arise, All human beings are holding up their whips." He must be an unworthy disciple indeed who cannot stretch out such an idea as that to any length that may be required. While his master is on the poetical side of the room counting out on his fingers the first few lines of some new poem, he, starting from the cue that "all human beings are holding up their whips," writes as follows:—

They are all on the stand, waiting to be taken. We ask our brothers of the earth to give us leave to toil. And they will not take us from the cabstand; they will not employ us: I do not say it by way of complaint, or of accusation; it is nobody's fault; it is the inevitable law of this great universe. But I say it is disheartening to hold up the anxious whip, and find no one wants us. It is weary work to stand all day in the marketplace, because no one has hired us; thinking of the hungry mouths at home, whose supper depends on our getting something to do. A young fellow is called to the Bar. He gets some little chamber in an out-of-the-way corner of the Temple; his name, painted on the door, is as his whip held up; in most cases held up in vain. When a number of girls, arrayed in splendour, are seen sitting at a ball on long forms set against the wall of the apartment, who can fail to think of the cabs on the stand?

* *Landscapes, Churches, and Moralities.* By the Author of "The Recreations of a Country Parson." London: Longmans & Co. 1874.

In spite, therefore, of the difficulty which at first sight attends the supposition that this age boasts of, not two, but only one philosopher, we yet shall cling to the opinion that such is really the case, as being on the whole that which involves the lesser difficulty. Not only is the law of chances altogether against the appearance at one and the same time of two writers who in the very same way and in the same branch of literature should each be the worst that the world had ever seen; but, moreover, if we are to allow that the world is under the government of a benevolent Providence, we can scarcely reconcile even with our imperfect sense of justice so unequal a distribution of dulness. Even though we have sinned, yet, like David, we ought to be allowed our choice of evils. Not on one century and on one country should such an amount of tediousness be bestowed that the Goddess Dulness will have to lie barren for a time before she can bring anything to the birth that will be in any way worthy of counting as her offspring.

This inquiry, however, is leading us too far from our present purpose, which is an investigation into the last of the productions of the philosophic pair, whether they be indeed a pair or only one mind in two manifestations. The title of the work, *Landscapes, Churches, and Moralities*, though curious, can scarcely be called misleading. It conveys no meaning, and rightly so, for there is no meaning to be conveyed. If we had been asked to stand godfather to it, we should have suggested some such name as Pompositives, Emptinesses, and Proings; or, No Matter in Many Words. The author sees the sun shine, as other people have seen it shine before him. He sees a cloud come over the sun, as other people have seen it come before him. Thereupon he sets to write nonsense about the sun and the cloud, as other people have not written before him:—

The sunshine was bright a little ago; but a cloud has come over the sun. Who will cry down Matter? It was the fashion to do so, once upon a time; but surely the fashion of those who forgot that it is the Garment whereby we see its Creator. And how close Matter often comes to Mind: sending out influences which interpenetrate what in us is most spiritual.

He has, like most of us, travelled by railway, and he has at the end of his journey found all his packages safe. "I have known," the good man says, "those who could not think of being pleased that, through many hurried changes of conveyance in a long worrying day, the abounding individual packages which make up a household's luggage are all forthcoming." He goes on to add, "I am sorry for the elevated intelligences described." Of how elevated a piety must a writer be who can thus pity those elevated intelligences who "are so big, intellectually and materially, that they cannot condescend in any way to notice" the Divine Providence that has been extended to them in the care of their household baggage, from their portmanteau to their sandwich-box and whisky-flask. It is possible, we would observe, to feel grateful, and to refrain at the same time from either uttering or writing nonsense. But, as our author observes, "you cannot by any usage bring out of any creature what was not potentially in it." Dignity of feeling and self-respect do not belong to certain men, and can never, therefore, be looked for from them. He takes this railway journey when going for his holiday. He gets to an English country lane, and a lane of so strange a nature that "on one side of it there are many green trees." There is a stile, too, in this lane. Here we pass away—but only for a line—from the *Moralities* to the *Landscapes*:—

I am sitting on a wooden stile. An English country lane is strange to me, for I do not live in England; and I have few opportunities of sitting on wooden stiles. In front are two green fields, their grass of a very deep green colour, golden-sprinkled with many buttercups. The fields slope down gently towards a little town. Beyond the town are green fields and woods, sloping upwards and making a green background to the little town.

From the midst of the town rises "an Object" (with a big O) "which I had come 519 miles to see." The reader is not to know what the Object is all at once. It is something that the author would rather see than "snowy Alp, heathery mountain, or broad ocean. In this May afternoon, whose light is somewhat overcast, sombre gray against a gray sky, the Object stands." At last the reader's curiosity is satisfied, and he learns that "the Object is Canterbury Cathedral." At this very moment it happened that some girls of gipsy hue passed, and "one of them, in the presence of the Cathedral, called another by many foul names." How great a risk she ran she little knew. "There is a place in this world where, if I had heard any young person speak as she spoke, I should kindly but strongly admonish the young person. But I have no right here." If ever we are inclined to give our tongue too free a rein, and we see a parson near us, we will first carefully inquire if it is in his parish that we stand. Often by merely crossing a road, or jumping over a brook, a man might still swear in the hearing of a parson, and yet swear in comfort. But to return to our author. A man cannot sit on a stile for ever, even though he has an Object before him, and from the stile accordingly our Country Parson must come down. He will not leave it, however, without a bit of moralizing:—

I must come down from my wooden stile. I am not likely to sit upon it any more. Parting, let me give a friendly pat to the rough post at one side of it, much decayed. I dare say that post is as old as I am. Yet I never saw it before. But there are things in this world which I never saw at all.

Among these things, however, is not the Fountain Inn at Canterbury, where the author had a solitary dinner, and after dinner a large cup of tea. We should have been glad, by the way, to

learn whether with this cup of tea he took sugar and cream. In the case of a great man the minutest circumstances are interesting. The solitary dinner is, we must confess, somewhat of a reproach to "Archy Tait," whom he had that day met. The Archbishop—shall we too venture to call him Archy?—had asked him if he had ever seen a cathedral before. "Such was the inquiry addressed to the writer, who knows (as nearly as possible) seven times as much about cathedrals as does the illustrious prelate himself." We hope, for the sake of the Archbishop's good name, that if his friend knows seven times as much, he has written seventy-and-seven times as much. We should be sorry to think so ill of the Primate as to imagine that he has written about cathedrals, or indeed about anything, one seventy-seventh part of the nonsense that is to be laid to the charge of the Country Parson of his native land. While our moralist thinks so slightly of the Archbishop in one point of view, we are glad to find that he is kind enough to admit that his place "beyond question is exceptional and a great position."

In one part of this book, though whether it comes under the head of Landscapes, Churches, or Moralities, we hardly know, we find an attack on those "who review books in such and such an eminent periodical." The author complains of depreciation. "I do not suppose," he says, "that all depreciation is intentionally dishonest. Of course there is a just and honest depreciation. You may say a thing is bad, because it is so; and you see it is so; and it is your duty to say so." It is quite clear that he is here using a word that is too big for him. He had better turn to his dictionary—not Johnson's, for he will not find the word there—and see what depreciation means. If we say that *The Recreations of a Country Parson* are of the same value as *Proverbial Philosophy*, that is appreciation. If we go on to say that neither one book nor the other is worth a brass farthing, that is still appreciation, though it might, perhaps, with more correctness, be called negative appreciation. He who sets its proper value on an article, however high or however low that value may be, does not depreciate, but appreciate it. In the same chapter in which those remarks occur the author tells his readers that, if they are driving a very swift horse, "they will be aware of a temptation to despise the people they overtake and pass by." He goes on to explain that, "by passing, let it be understood I mean overtaking, and in that sense passing. It is comparatively easy for even a very sluggish steed to pass the very swiftest, provided the two are going in opposite directions." Now when we come across such writing as this, and strip off as it were the lion's skin in which it is wrapped, and show what it is that is beneath, we are not to be reproached with depreciation. It was our duty to set a fair value on the book, and we have, we maintain, valued it correctly. It is worthless, and we have said that it is worthless.

A LOST CHAPTER IN THE HISTORY OF MARY QUEEN OF SCOTS RECOVERED.*

THE discovery that suggested the publication of this little volume can be described in a few words. Before Bothwell could be married to Queen Mary it was necessary to rid him of an ostensible wife in possession. This was accomplished by a divorce through the proper tribunals both of the Reformed and the Romish Churches; and in this latter the ground of divorce was that Bothwell and Lady Jane Gordon, whom he had married, were canonically within the prohibited degrees. If this marriage had been preceded by a Papal Dispensation, it could not have been thus extinguished. Was there, then, a Papal Dispensation? All dispute on this branch of the great question is now at an end. The Dispensation itself has been found by Dr. John Stuart, who now comes forward to comment on the significance of the document he has so recovered.

There can be no doubt that this discovery is "a heavy blow and a great discouragement" to the devotees of what we may call the minor Mariolatry. The more, therefore, must we admire the chivalrous courage of Mr. Hosack, who, in the second volume of his clever case for the defendant, before there had been time to know the impression made by the Dispensation, comes forward at once and assails the enemy before he has had time to bring the new auxiliary contingent into his available force, in this wise:—"There is one undisputed point in the history of Mary—namely, that throughout her life she was true to her religion; and, although she explained to her relatives in France that she had been forced by circumstances to consent to marry Bothwell, there is nothing in her conduct or in her correspondence which indicates a doubt as to the validity of the marriage. We shall find that at a subsequent period she appears to have been made aware of the true state of the case; for, in writing to the Pope in the year 1571, she speaks of the 'pretended divorce' of Bothwell from his wife. But the question is, whether at the time she knowingly contracted an invalid marriage." "Nor can we come to any other conclusion than that the existence of the Papal Dispensation had been carefully concealed from the Queen both by Bothwell and by his wife." If it be a point gained to show that Queen Mary once in her life

* *A Lost Chapter in the History of Mary Queen of Scots Recovered.* Notices of James, Earl of Bothwell, and Lady Jane Gordon, and of the Dispensation for their Marriage; Remarks on the Law and Practice of Scotland relative to Marriage Dispensations; and an Appendix of Documents. By John Stuart, LL.D., Secretary of the Society of Antiquaries of Scotland. Edinburgh: Edmonston and Douglas. 1874.

spoke truth, she did so when she used the words "pretended divorce"; they were words of style, then and still in use in the Scottish law courts, when a litigant refers to a document which he intends to abjure as not obligatory on himself. But when she used this term she was in the third of her great love passages, pouring out her devotion to Norfolk somewhat after the fashion of the Oasket Letters, and frantic to get rid of the Bothwell entanglement.

That so clever a woman as Mary should remain in confiding reliance on such a swain as Bothwell, and never inquire whether he and his wife had provided themselves with the customary protection of the period against the pitfalls of the canon law, is a conclusion hard to be believed. It is harder still to believe it when we look at the active and kindly interest taken by Queen Mary in the happy union of her champion to the house of Huntly, which she had been compelled to ruin when she was under the influence of Murray, and now was earnest in restoring to its departed greatness. Dr. Stuart prints their contract of marriage in his appendix. It sets forth that the union is "with advis and express counsall of our souverane Lady Marie Queen of Scotland," and here is the first signature, "Marie R." Further:—

The marriage was solemnized on the 22d of February, and the proceedings connected with it are described by Pitcottie in the following terms:—"Vpon the 22 day of Februar the earle of Bothwell was married vpon the earle of Huntlies sister. The king and queine maid the banquet the first day, quibill continued fyve dayes with justing and tournameitis, and thair was maid six knyghtis of Fyft at that time."

The Queen's great interest in Lady Jane appears not only from her joining in the contract, but in the gift which she made to her of a wedding dress of cloth of silver, lined with taffeta, which is thus described in the Royal Inventory:—"Plus xii. aunes de toyllie dargent plainne pour faire vne robe a la fille de Madame de Montelles pour le jour quel fut marrie a Monsieur de Bodoud." The Queen also bequeathed to her a head-dress in her Testamentary Inventory, drawn up in the end of May or beginning of June 1566, where it is thus entered:—"A Madame de Boduel, vne couiffe garnye de rubiz perles et grenatz."

It would help us to some instructive inferences about the motives influencing the busy men of that strange world of Scottish politicians if we could point to this and that one among them as having been aware of this Dispensation. That arch conspirator Archbishop Hamilton surely knew of it, since the Dispensation is signed by him as Papal Legate, and the divorce, for want of a Dispensation, was effected in his Consistorial Court little more than a year after the Dispensation had been granted. It could scarcely be said that the busy public officer should allow such events to escape his memory in the crowd of business passing officially before him, as the clergyman of a London church may forget the individual Jones, Brown, or Smith, whom he has married or baptized among the other thousands. If we could bring home the knowledge to others, it might help us to conclusions—as, for instance, about that unaccountable affair of the supper at Ainslie's, when an assemblage of men about the bravest and haughtiest in the world appeared to be subdued into a joint act of arrant poltroonery. The theory that they thought it the best policy that things should drift on to the ruin which was imminent becomes the more likely if they knew the marriage to be a farce that would disappear from the arena of substantial political forces. Wherever we shall find that an approver or promoter of the marriage was acquainted with the existence of the Dispensation, we can understand that he gave the go-by to what was done, in the assurance that it could easily be undone. There were two persons who not only approved and promoted, but were keenly zealous for the completion of the affair—the Queen and Bothwell—and, like all heedless lovers, they hid out of sight the impediment to their happy union. There is, no doubt, another view, that the poor Queen was driven to the fatal act by the tyrannical power of her evil genius; but knowing, as she must have known, of the Dispensation, she also knew that she could call up what would have evoked the powers of her own Church against the final calamity, and have protected her effectively against the odious union.

It may naturally occur to those not deeply versed in the historical mysteries of the age to ask, What was the degree of kinship between Bothwell and Lady Jane Gordon? Because, if it was anything approaching to the forbidden degrees of modern times, its existence must have been notorious, and all men must have known whether it required a Dispensation to overrule the obstacle to marriage. This leads us to a curious and very significant field of inquiry. The personal interest attaching to the principal characters in the strange story naturally attracts the greater amount of current attention, but the legal, religious, and social conditions revealed by the affair of the Dispensation and the divorce are of far deeper historical import. Bothwell's grandfather had married Lady Margaret Gordon, the daughter of George, Earl of Huntly, who was the grandfather of Lady Jane. Had the connexion of the two been a degree still further apart, it would still have been within the canonical prohibition. For this widening of the prohibited circle there was no excuse in any of those physical or social grounds which are held to justify the marriage restrictions of modern times. It was simply a device to increase the power of the Church, and especially its power to extract money. The whole thing became a system of taxation. The Church, after a long contest with the State, had got possession of all that great department of the law which deals with marriage and legitimacy, and, as it consequently dealt with the succession to property and dignities, it was a power acutely felt; the higher the rank and the greater the wealth of a family, the more thoroughly was it at the mercy of the Church.

It happens that Scotland has enriched our knowledge of the

relations between Church and State in the early part of the sixteenth century with many illustrations of the degrading influence of that system. We may suppose that other small States might have been equally fertile in such examples; but, whatever may have been the facts, no part of the world seems to have contributed so large a body of examples to record and history. That England should be less fertile in such lore has a distinctive cause—its larger population, and, even proportionately to this larger population, its greater number of wealthy families. In a small aristocratic body, proud and exclusive, there were naturally many intermarriages; and thus, though the wealth of the land was small, the Church was able to extract a large proportion of it. We owe to the exasperating influence of this and of other clerical aggressions the fierce and vindictive tone of the Reformation in Scotland, where the aristocracy at once headed the people in a crusade for extinguishing the Romish hierarchy.

The most really valuable part of Dr. Stuart's little book will be found in the instances he supplies of the systematic precautions taken to obtain the aid of the Church in keeping clear of all the traps laid by it, and the assurance manifested in marriage contracts and other dealings concerning marriages that every impediment was removeable at its proper price. The following instances bring in parties closely connected with the principal object of the present inquiry:—

In the year 1491, Patrick, Earl of Bothwell, grandfather of Queen Mary's husband, agreed to marry one of the two daughters of George, Earl of Huntly, and the contract provided "gif ther be any impediments of affinite or consanguinite funden in the meyne tyme quhairthrow the said mairage may not have progress efter the law of haly kirke, the remede thairof be procurit, and a dispensation gotten in all possible haist be comon expens of baith partys."

In the year 1530, a marriage was arranged between George, Earl of Huntly, and Elizabeth Keith, sister of William, Earl Marischal, which was to be solemnized "als sone as ane dispensation may be gottin of the Papis halyne fra the Court of Rome, or quhair euir the Papis beis, for impediments of consanguinite or vtheris standing betwix the said George and Elizabeth that may be stop to thair lauchfull mairage; the quibill dispensation the said William, Earl Marischal, and his freinds sall cause be brocht hame upoun thair expens with dew diligence, quibill beand brocht hame, the said George, Earl of Huntly, sall redely vse the samin dispensation, and compleit mairage with the said Elizabeth but any longer delay."

The contract also provided for another contingency which might emerge after the marriage had been completed, "that gif thair happynis or occuris any caus of dinorce or impediment of law quhy the said George, Earl of Huntly and Elizabeth Keith may nocht lauchfully remane togidder in mairage efter that thair be anis mairyt be way of deid, als oft as any fit caus of dinorce or impedimentis occuris, the said George, Earl of Huntly, sall, als sone as any sic impedimentis cumis to his ciris, with all possibill diligence send to the Court of Rome for new dispensationis, and sall obtene and get thame, and bring thame hame to conferme the matrimony standand betwix thame, makand the barnis lauchfull than gottin or to be gottin betwix thame, and abill to succedd to the said George's heritage, thair beand aris mail."

The next instance makes us acquainted with an audacious enlargement of the prohibitions to include spiritual relations, as they were called, gossips, god-sibs—those who came into the family or, in Scottish and old English phrase, became "sib" to it, by acting as godfathers or godmothers at baptisms. Further on the passage here selected from a contract creates an obligation to obtain by the necessary payment the removal of all such difficulties as the prying eyes of the priests may discover after the marriage; and, should such an extreme measure be necessary, to procure a divorce, and after that a dispensation for a new and legitimate marriage:—

In the year 1487 Alexander Fraser, the laird of Philorth, agreed to marry Marjory Calder, another daughter of the Thane. The indenture thereon provides, "Ande because the said Alexander Fraser is godbrother to the said Marjory Calder, and echo gode-sister to him, quaharfor thair mair hafe licence and be dispensit of our haly father the Pape, and the said Wilyame, Thane of Calder, sall mak the fyrst cost one the dispensacion, and the said Alexander Fraser sall recompens and make pament tharof efterwart quhen he beys lauchfullie in possessione of his landis of Filorth."

In February 1523 a marriage-contract was entered into between Malcolm, Master of Fleming, and Janet Stewart, daughter of Agness, Countess of Bothwell. It narrated the existence of impediments "quhairthrow thair may nocht compleit the said mairage at this tyme," and the agreement of the Countess to "send to the Court of Rome and get and bring hame uppon hir expensis ane purches and dispensacione upon the saidis impedimentis," and on their being received, to complete the marriage.

There was also a provision for any emerging impediments, in the following terms:—"And gif any impedimentis efterwart to be propounit or knawin be the said Malcolm, and upon his behalf, quhairthrow the said mairage betwix hym and the said Janet may nocht stand in the face of haly kyrk, the said Malcolm sall, upon his expensis, in all possible haist, send and bring hame ane purches and dispensacione furthe of the Court of Rome for contracting and completing of the said mairage of new betwix hym and the said Janet in face of haly kyrk, as efferis, and incontinent therefor sall compleit the same."

In 13th February 1554, Hugh, third Earl of Eglinton, contracted to marry Lady Jane Hammiltoun, daughter of the Duke of Chateherault. One of the conditions of the contract provided—"And farther gif it happinis in any tymes herefter that any causis or impedimentis of consanguinite or affinite, or utheris quhatsumever be kend or knawin betwix the saidis Erle of Eglintoun and the said noble Ladie, quibikis happinis nocht to be dispensit befor the contracting of the said mairage, the said Erle uppon his expensis sall obtene dewlie and bring in thair partis ane new dispensacion or dispensacionis for removing of the said impedimentis als oft as need beis with ratificatioun of the said matrimony notwithstanding the saidis impedimentis; or than sall divorce the said first matrimony be occasion thairfor, quibik being thairthrow divorciat, the said Erle sall incontinent thairafter cause use the saidis new dispensacionis dewlie, and of new agane contract and solempnizat matrimony in face of haly kyrk with the said Ladie Jane."

Lady Jane was afterwards married to the Earl of Sutherland, and on his death to the Laird of Boyne. It is interesting to those who have traced her through the stormy events of her first married life to find her living in tranquillity, and dying at Dunrobin in

her eighty-fourth year, a prosperous gentlewoman, who, in the words of her son, "always managed her affairs with so great prudence and foresight that the enemies of her family could never prevail against her" (p. 55). She took to Dunrobin two important documents. One was the Dispensation; the other, the security for her dowry over the wide estates of the Hepburns, Lords of Bothwell, of which she claimed and obtained payment after the divorce. May we fairly consider that these two possessions had some connexion with each other, and that the Dispensation was carefully preserved as a document which, in the hands of a woman of "so great prudence," might, under possible chances, be an available resource should any difficulty arise about the punctual payment of the dowry money?

A NEW ORIGIN OF THE ENGLISH.*

EVERYBODY, it would seem, has his use in the economy of things, and the use of Mr. Boulton is to make us understand certain mysterious utterances which have been put forth at various times during the present year. To say nothing of less famous names, Mr. Whalley has been crying out for a new History of Britain, freed from all the Popish fables which men have hitherto drawn from the spurious "Saxon Chronicle." If the Chronicles are spurious, who forged them? There is a view according to which all the Chronicles were forged by the one man Marianus Scotus, who died a good many years before the narrative of the latest Chronicle came to an end. Mr. Whalley, more prudently, assigns the forgery to "the Augustine monks of Canterbury," a class of men so shadowy that they may be safely quartered in any century that may be convenient. Now we do not see that our present light, Mr. Boulton, commits himself to this doctrine of the forgery of the Chronicles; but his notions of the origin of the English seem to be such as would exactly suit Mr. Whalley and its other supporters. His two little tracts, read before two local Societies—the former comes from the Transactions of the Historic Society of Lancashire and Cheshire, 28th November, 1872—look like the fore-runners of what we are to get when Mr. Whalley girds himself up to tell us the true history of Britain, free from all Popish fables and Saxon forgeries.

Mr. Boulton has a way which is not peculiar to himself of marking common errors as errors, and then putting greater errors in their place. For instance, he seizes on the popular abuse of the Saxon name; he objects to confounding Angles and Saxons; he very properly refuses to believe that Egbert "invented the name of England or called himself King of England." Only, when he comes to give us his own views, the distinction which he draws between Saxons and Angles is so very wide that we should much rather sit down contented with the popular confusion of the two. "Angli," according to Mr. Boulton, in *Isida* and everywhere else, it would seem, up to Æthelward, rigidly excludes all Saxons. Egbert called himself "Rex Anglorum," not because he reigned over Angles or English in any sense, but because he did not:—

That the King of Wessex, in the hour of victory over the powerful and more civilized Angles, should dub himself for once their King, was natural and excusable elation; but such an act is very insufficient evidence in favour of the Teutonic theory. It was not until a much later period that the sovereign was styled king of the country instead of the people: and though to render *Rex Anglorum*, or cyming of Angle cymn, or Angle-isc, by King of the English, be orthographically correct, the impression conveyed would be erroneous, unless it were distinctly understood that the Angle cymn or Angle-isc did not include the Saxons any more than it included the Welsh, or the Scots and Picts.

This is startling, but it is certainly not too strong, if we could only believe with Mr. Boulton that the Angles were not Angles at all—that they had nothing to do with the "Angli" of Tacitus or the Ἀγγελοι of Procopius—that they never came over from Angeln, but were, as far as the present discussion is concerned, *autochthonous*—that they were in short no Teutonic invaders, but true-born Britons—that their name has nothing to do with "angul" the weapon, nothing to do with their living "in angulo," nothing, we regret to say, with their "angelica facies, id est, pulchra"; what it has to do with Mr. Boulton must teach us. When the Romans left Britain, the "un-romanized Britanni" formed two classes, each with a descriptive name:—

These tribes may be naturally grouped under two divisions—(1) those who retained the primitive habit described by Caesar of living in woods; and (2) those who had sought refuge among the hills. The latter are still known to us by the Teutonic name of Welsh, which, as a corruption of Wyl-isc, aptly denotes an aboriginal people; for *wyl* is the original of *wealth* or *well*, a fount or spring; and *isc* of the terminal *ish*, which is an adjectival form of frequent use; and Wales thus represents the land of the Welsh.

In what language "*wyl*" is the original of *wealth* or *well* Mr. Boulton does not explain, but we can cordially assent to his proposition that the "terminal" *isc* or *ish* "is an adjectival form of frequent use." If, for instance, we were so rude as to say that Mr. Boulton's etymologies were "foolish" or "childish," or that his reasoning was sometimes a little "Irish," all these words would be cases in point. But it is more important to know why the Angles were so called:—

The other portion of un-Romanized Britanni, who would mainly occupy

* *The Angles, Jutes, and Saxons.* By Joseph Boulton, F.R.I.B.A. Liverpool: Brakell. 1873.

The Danish Invasion into South Britain. Read before the Literary and Philosophical Society of Liverpool, January 26, 1874. By Joseph Boulton, F.R.I.B.A.

the Eastern and Midland districts as the Cymri occupied the West, would probably likewise be named from their habits of life; and as those who sought the protection of hills were thence called Cynbri; those who sheltered in woods would be thence termed Angellous, contracted into Angles, from C. *an-geill-eis*, men of a very wooded country, i.e. foresters; *geil*, signifying a wood or wooded country, *eis* a man, and *an* being an intensive particle. If this conjecture be correct, their great numbers, and the influence so speedily acquired by the Angles, are readily understood; those numbers having led earlier historians to infer the depopulation of the mysterious continental Anglia, by which it was reduced to a desert for three centuries! Similarly, modern historians have supposed that the Celts were extirpated to make room for all these foreigners; just as, in comparatively recent times, the native black rat was exterminated by the Hanoverian brown rat.

Mr. Boulton perhaps hardly knows how happy an illustration he has lighted on by his little excursion among the "majores mures qui vulgariter vocantur rati." Mr. Dawkins might perhaps enlighten him a little on that head. But we must give one or two more illustrations of this mysterious word Angle:—

The words *an-gril*, very woody country, or their equivalents, *angel*, *angle*, *engel*, *engle*, *ingel*, and *ingle*, appear in names in many parts of South Britain; and possibly *ongle*, *ungel*, *ungel*, and *angle* may sometimes be equivalents also.

A long list comes of words in many of which Dr. Guest would doubtless gladly recognize the Anglian element; but why, to mention no others, Ardingleigh and Bletchingleigh? What can these tribal names have to do with Angles? And, to crown all:—

The most remarkable examples are in Wales, amongst the Cymri, where appear Morston, Anglecourt, Angle, and Angletown, with the names of forty-three places with the termination *angel*; thirty-three of these are Llanfihangel, distinguished by various affixes; nine are Llanvihangel, and therefore substantially the same name; and one Llanmihangel. In England proper there are a few more, probably in Hereford and Monmouth, but their position is not ascertained.

"Angle" is most likely "Nangle" in Pembrokeshire, sometimes corruptly called "Angle," which however is not "among the Cymri"—Mr. Boulton means *Cymry*—but among the Flemings, and it has nothing to do with woods or with Angles, but means "in angulo," just like Nyland, for "in-island." But conceive a man who dabbles in Welsh etymologies fancying that *Llanfihangel*—the three spellings are of course indifferent—in English *Michaelchurch*, has anything to do with woods or with Angles!

After this, it is hardly needful to pay much heed to Mr. Boulton's attempts in the way of Celtic etymology. Yet we have a certain curiosity to know how it is that "C. *Brito*, a Briton, is compounded of *bri*, a hill, and *to* a man"; while elsewhere "there can be little doubt that the name of the country was derived from its unique, or almost unique, production, tin; C. *brith*, to produce or bring forth, and *stain ostan*, tin." Does Mr. Boulton hold that the name of the island and the name of the people have nothing to do with one another?

The following sentence is also very dark; still each clause by itself has a meaning;—

That Welsh is comparatively a recent dialect seems probable from the difference between the speech of the two Cymri, those of Wales, and those of Strathelyd, the latter of whom have never deviated so much from the original Celtic type, which appears to form the basis of modern English.

The upshot of all this is that the Angles or English are not a Teutonic people who came into Britain from beyond sea, but a Celtic people, who at most moved from one part of Britain to another. We suspect that something like this has been stirring in the brain of Mr. Whalley and his allies. But Mr. Boulton, unlike his fellows, has put the doctrine into a shape in which any third person who is so inclined may say Yea to it, and any one who thinks it worth while to take the trouble may say Nay to it. We will only remark that the doctrine is altogether different, both from that set forth in Mr. Coote's *Neglected Fact*, and from that which is preached by Messrs. Piko and Nicholas. Neither of these last doctrines denies the fact of the English Conquest. Mr. Coote's doctrine is, not that the English are Celtic, but that the old Britons were Teutonic. The other doctrine is, not that there was no Anglian settlement from beyond sea, not that the Angles were Celts, but simply that they were so few that, in the land which they conquered, the prevailing blood was that of the conquered and not of the conquerors. These doctrines are perhaps worth being refuted; they misinterpret the facts of history, but they do not deny them. Mr. Boulton simply gets rid of the facts altogether. Yet still Mr. Boulton does say something to which it is possible to say Nay; he has so far the advantage over his allies, who speak with such stammering lips that they give us nothing to say Yea or Nay to.

But, when Mr. Boulton has got rid of the Angles, he has still the Saxons and the Danes to get rid of. We do not exactly see why Mr. Boulton asks, with some warmth:—

If the name of Saxon was unknown until the date assigned by the legend (A.D. 476), how was it the Romans called one of their marches the Saxon Shore? and how came they to defend their possessions from Saxon invaders, as in A.D. 367?

Whom has Mr. Boulton met with who said that the name of Saxon was unknown till 476? No one certainly of our acquaintance, no one who has read Ptolemy, no one who has read the Notitia, no one who has read the well-known passage of Claudian which Mr. Boulton himself quotes, though he oddly complains that it is "without the rhyme [*sic*] of hoar antiquity." An ingenious man once turned the *Æneid* into Latin rhyme, and Mr. Boulton may be prepared to do the same service for Claudian; but is he prepared with a rhyme for "Saxone," accented, as Claudian accented it, on the first syllable? But, be this as it may, Mr. Boulton defines the

Saxons to be "a Romanized Frisian and native people, who, being exceptionally clothed in breeches, were called 'Sacs,' corrupted into Saxons." We thank Mr. Boulton both for the Frisian connexion, and still more for the breeches; two such gifts may almost make up for the unkind insinuations that these well-breeched Frisians spoke Latin and did not come from beyond sea. Mr. Boulton's doctrine of Saxon breeches delivers a large part of England from all suspicion of "naked ancestors"; and it is much more comfortable to be called a Saxon because one's breeches are "baggy" like a "sack," than to be told that one is a Jew or an Edomite, and that "Saxon" = "I-saacson." May we not go on further to infer that the grants of "sac and soc," so common in Saxon charters, really refer, not to jurisdiction of any kind, but to a solemn investiture by the royal hand with the distinctive garment of the race? Saxon Kings are hailed as "bracelet-givers"; may they not have had an equal right to the no less sounding title of "breeches-givers"?

Mr. Boulton's tract on the Danes is almost worth reading, because it might give a useful hint or two to the Danish scholars and their enthusiastic followers in England. Mr. Boulton has read the book in which Worsaae goes through England, and whenever he sees, as of course he sees at every step, things, in language or anything else, which are common to England and Denmark, sets them all down as instances, not of the common origin of English and Danes, but of direct Danish influence in England. As usual, Mr. Boulton sees through this crotchet, only to set up a worse crotchet of his own. We have long believed that there is no scratch on any stone in the world but a Danish antiquary will read it into good Danish, and an Irish antiquary will read it into good Irish. So it is with etymology. Where Worsaae sees Danish, Mr. Boulton sees Irish, Welsh, Celtic of some kind. That anything should be simply English of course does not come into the head of either. And, by the process by which "Alexander the Great" became "all eggs under the grate," any English word can doubtless be read into Irish or into Chinese. Here are some specimens:—

Wulfstan—*ull-fas-tax*, prince of great understanding or wisdom.

Ulfketil—*ull-fas-et-il*, very great wisdom mouth; one renowned for wise speech.

Edmund—*End-mann*, the bounteous giver of protection, that is, the generous protector.

Olla is the name of a townland in Tipperary.

Lastly, let us see Mr. Boulton in his very highest flight:—

In the names of Robinson, Benson, Lawson, Rawlinson, the affix -son is apparently K. *sun*, an enclosure, and Benson, or Penson, is the enclosure on the hill-top; Robinson, on the road at the hill-top. The name Robin as the name of a place denotes its position by a road at the top of a hill; but as a Christian name, I apprehend, Robin is derived from the Redbreast, in these latitudes the universal friend and pet of man, who naturally applied the name to his pet son, just as he playfully called him a little monkey or a young urchin, that is, piggy-wiggy, from K. *urcun*, literally the earth kin. Pigs are still called urchins in Lancashire; hedgehogs generally bear that name; and the sea-urchin, common on our coasts, derives its name from a resemblance to the hedgehog. The Robin is the wound-bird, K. *rub-en*. Its other Keltic name, *ruddeock*, signifies red-breast, *rudh-oc*.

What has Mr. Boulton to tell us—we will not say about Reynard the Fox, but—about the *Tom-tit*, the *Jack-daw*, and the *Mag-pie*? According to Mr. Boulton, Tom, Jack, and Maggie must all have been called from the birds, and not the birds from them. And, to rise from birds to mammals, a kingly and saintly English name has, under the irreverent form of "Neddy," sometimes been bestowed on the beast which others—of Norman or scriptural tendencies perhaps—spoke of as a *jack-ass*. Does Mr. Boulton think that the nine Kings who have borne the name thus abused were really so many examples of a nomenclature analogous to the *Onedai* of Sikyon or the *gens Asinia* of Rome?

LINLEY ROCKFORD.*

THERE are two things which go mainly to the making of a novel—its plot and its characters. It may be asserted as a broad fact that the best form of novel is produced by the combination of excellence in both these things. The second rank is attained by those novels in which one of these things is excellent. That rank which is numerically largest is composed of those in which neither is excellent. It may be asked whether the plot or the characters are the more important element in the success of a romance. The answer will not be far to seek. There are many instances of fictions which by the force of their characters have risen to the very highest place in spite of an ill-constructed or defective plot. It would be difficult to find an instance of one which by the skill of its plot has triumphed to a like extent notwithstanding a want of life or probability in its personages. A combination of intricate convolutions of circumstance, a series of traps set by fate to which men and women play puppets, may excite a breathless excitement once; but there is no depth of interest in it. When its impression has once been conveyed to the mind, no further interest or excitement can be derived from it. When characters, on the other hand, are depicted skilfully and forcibly, the attention aroused by the book wherein they have their being is of a more permanent if of a less violent kind. There is a more vital interest in the natures than in the circumstances of men. It is curious that the talent for representing human beings with tolerable accuracy seems far more

common than that for weaving together incidents which shall be tolerably probable and exciting. For one writer who can contrive an ingenious plot, there are very many who can give a decently good picture of life and manners. One is almost tempted to think that the gift of making plots is as absolutely a native gift as that of poetry. To very few authors is it granted, as it was to Scribe, to see yet unborn plots in every accident of life, even in every scene of nature which came under his notice. To him a chance meeting with a friend suggested the plan of a vaudeville, while in a beautiful sunset he saw the development of a drama.

It is true that those who construct plots for romances in the present day have a difficulty to contend with which was unknown to their predecessors. Nowadays every day in the year sees the birth of a work of fiction, and every fiction must have some kind of plot. Thus all possible combinations of circumstances get more and more exhausted, and it becomes daily more and more difficult to invent any which shall be unforeseen or startling. It would therefore be ungracious to complain that every coming event casts its shadow before, to the eye at least of the experienced novel-reader, in the course of *Linley Rockford*. It is pleasanter to note that the characters of the book are some of them drawn with more than average merit, while none fall into the region of caricature, as did one at least of the personages in Mr. Justin McCarthy's last production.

Linley Rockford is, oddly enough, the name not of a hero but of a heroine. She is introduced to the reader as the young wife of "a rich, handsome, and accomplished man" who discovered her helping to keep school with two maiden aunts at Bonn, and, having married her, brought her over to his country house in England. This house is situated in a remote village called Dripdeanham, close to the edge of the sea. Linley is full of dreams of the good which she will do among the villagers. She wishes to give every one a share in her new happiness. She looks up to her husband as the ideal hero of her life, handsome, dignified, full of good qualities which he sometimes hides under a veil of laziness and selfish philosophy. The reader finds out much sooner than Linley does that her ideal picture of her husband is very far from reality; that the good qualities which she, out of her own goodness, assigns to him, are imaginary, while what she takes for a veil of laziness and egotism is in truth the substance of the man. It generally happens in the conjunction of two people that if one entertains an entirely mistaken view of the other's character, the mistake is reciprocated. Dr. Wendell Holmes has said that in every conversation of two there are six persons engaged—each speaker's real self, each speaker's ideal of himself, and each speaker's ideal of his companion. In the case of Linley and her husband some time elapses before either discovers that the ideal pictures which they have made are false. But while Linley's imagination converts a commonplace husband into a hero, his represents a woman of a high mind and noble impulses as no more than a pretty girl who will be willing to fall into his ways of selfish indolence and will be a graceful ornament for his house.

Dripdeanham is inhabited by a rather eccentric set of people, and the most eccentric of these, a retired navy doctor called Tuxham, comes to call on Linley the day after her arrival. Mr. Tuxham is drawn with some skill. The character of a good-hearted cynic is common enough in literature of all ages and nations; and therefore the more credit is due to Mr. McCarthy for having managed to give a new view of such a character. One of Mr. Tuxham's pet vanities is that, in spite of his partly natural, partly affected, roughness of manner, he has a peculiar faculty of understanding and being understood by women. This he illustrates by hinting to Linley during a walk through Dripdeanham that her husband is not quite the magnificent character which she imagines him to be. The simple manner in which he brings this conclusive proof against his favourite theory concerning himself is happily touched. In the course of the same walk Linley discovers for the first time the existence of a bosom friend of her husband of whom she has never heard before, Roche Valentine by name. Mr. Tuxham compares them to Patroclus and Achilles, and Linley immediately settles that her husband is Achilles. Roche Valentine, who does not appear until later on, is at once the best and most interesting character of the book. There is some skill in the analysis of his mind, which is presented to the reader more by a view given of the man himself than by comments and explanations from the author; there is yet more skill in the method by which the reader is shown how natural it was that Linley as well as others should entirely mistake Valentine. At first sight it seems improbable that a close friendship should exist for many years between so fine a nature as Valentine's and so mean a one as Rockford's; it appears unnatural that a man of high principle should be absolutely devoted to a man of none. This apparent contradiction is cleverly explained in a speech of Valentine's. In spite of this, however, one cannot but think it strange that Valentine should have borne with his friend for so long. Nor can one help reflecting that one reason for this may be found in the fact that, had things been ordered otherwise, there would have been an interest wanting to the story of *Linley Rockford*.

During the walk through Dripdeanham which has been spoken of, another event quite as important to Linley's future as the discovery of Valentine's existence occurs. This takes the shape of a ragged orphan girl who is found standing at the door of a deserted cottage. She claims to be the daughter of an Oriental prince. Her dusky complexion, and the fierce pride of her demeanour, seem to point to her being of Oriental blood, whether royal or not. She

* *Linley Rockford*. A Novel. By Justin McCarthy. 3 vols. London: Tinsley Brothers. 1874.

rejects with scorn all offers of help from Mrs. Platt, the kind ungrammatical wife of an equally kind millionaire who began by being a boy in a factory. But to Linley's advances she responds immediately; and Linley, touched by her helpless condition and her affection, instantly resolves to adopt her. It is not difficult for him who is versed in the ways of novels, and is acquainted with the details of the facts in this novel, to conjecture that the kind action performed by Linley at the outset of her married life should lead to the most terrible incident in that life. Given a heroine married to the wrong man, it is obvious that some means must be devised for her discovery of her mistake and for its being set right. There are two contingencies which might occur in real life. Either she might never find out that she was mistaken; and it is not an unusual experience that a clever wife continues through life to delude herself on the subject of her husband. Or, if she did discover that her supposed Mr. Rochford had no greater reality or substance than Hawthorne's Feathertop, it might happen that no convenient retribution would overtake the real Mr. Rochford. Only then there would be no novel.

The manner in which Linley's final discovery of her husband's worthlessness is arrived at is by no means the most happily contrived portion of the book. Rochford's descent from idleness and self-indulgence to the confines of crime is too rapid. Again the character of Sinda, the orphan girl whom Linley has adopted, is ill worked out, or rather it is no character at all. She is merely a puppet who assumes various characteristics from time to time as they are needed by the development of the story. Her brother, the facile, scheming, feminine young man who manages to elope with a fashionable beauty whose heart was never touched before, is far better drawn. The different impressions which he makes upon each of the characters with whom he is thrown in contact are both true to nature and well indicated. The catastrophe of the book is, as has been hinted, a little weak: it is too like the life of novels; too unlike that of the world. If there were a little less of absolute chance in the meeting between Linley and Roche Valentine which leads to the final and happy conclusion of affairs, one would more readily give credence to it. The *fœcile* of an accidental encounter occurring only just in time to bring things to a fortunate instead of an unfortunate end is too well known. However, there are many readers to whom a certain pleasure is afforded by the recognition of well-known friends in a new novel in the form of incidents which have done good service in old ones. Those readers who are wearied rather than delighted by meeting ancient acquaintances of this kind may console themselves by the skill with which Mr. McCarthy has handled many of his characters. Here is a specimen of the author's work which may be selected in support of this assertion. Linley has gone to visit a poor woman in Dripdeanham, and found that her husband has just died. "He died yesterday," says the widow in a matter-of-fact tone:—

"He was very good to me allus," said the widow, as she arranged the covering. "Never rose his hand agin me—never but twice; and once it was along of Mary Salmon down yonder."

She nodded and jerked at some direction, which was of course unknown to Linley, and she kept on talking in her hard dry way, feeling evidently a relief in talking.

"We quarrelled about her. He and she got too thick, I fancied. So they were, too."

"This was before you were married?" Linley said, assuming that she ought to ask something about the far-off lovers' quarrel, which was pressing so sadly now on memory.

"Eh, ma'am? no, sure. You don't think a man like him would lift his hand to a woman he had no right to? Eh, no; we were married many a year. I got a bit jealous like, and I scolded him, and he up with his hand—that was all."

PALMER'S OVID.*

NOTWITHSTANDING the fact that, as Dean Merivale has observed, "the first classic pages we put into the hands of our children, and among the last on which we turn the gentle retrospect of our own declining years," are those of Ovid, a critical edition of the *Heroides* comes upon us as a sort of surprise. That his more licentious works should be left without annotation is just as well; but it is only the familiarity with the Epistles which the English schoolboy contracts in the lower forms that can dull a maturer apprehension to the various fields of illustration, annotation, and criticism which those of them that are genuine unfold. Distinct from, although not alien to, Ovid's characteristic domain of erotic elegy, they exhibit his ideal of a love-lorn woman's rhetoric in a series of fictitious love-letters which are a strong relief and contrast to the wantonness of his *Ars Amatoria*; and, in their own way, it may be doubted whether they have ever met their match. Whilst, too, in tone and purity they are for Ovid exceptionally blameless, they represent with as great felicity as any of his compositions the tact of language, the mastery of form, the ease and grace which are so characteristic of the most delightful of Roman elegiac poets; indeed they are a useful study, as the editor of the volume before us has shown, in discriminative criticism, inasmuch as Ovid's style and characteristics set so clear a mark upon his own undoubted Epistles that the half-dozen answers composed by his friend Sabinus, and the one or two spurious imitations by nameless rhetoricians, find

summary confutation in an exaggeration and clumsiness utterly foreign to the bard of Sulmo.

Mr. Arthur Palmer deserves the thanks of all scholars for calling more minute attention to Ovid's qualities as illustrated in the *Heroides* than they have commonly met with; and for claiming for his earlier muse, of which the *Heroides* were a first fruit, such a place in romantic poetry as they eminently deserve. Clearing away, in imitation of Lachmann and Madvig amongst others, the last seven epistles of the twenty-one usually published as Ovid's *Heroides*, Mr. Palmer justifies such a summary proceeding in the case of the Epistle of Sappho by the obvious centoism of its manufacture, and by its palpable anachronisms of style and allusion. As to the rest, from the sixteenth to the twentieth inclusive, he condemns them for their un-Ovidian prolixity, their observance of Alexandrine rather than Homeric or tragic models, their "lax, creeping, mawkish tone," and their departure from Ovid's earlier use of a disyllable for the close of a pentameter. Our readers, if they choose, may glean from Mr. Palmer's preface more special and precise reasons for detaching the last seven of the so-called *Heroides* from Ovid, as well as for hesitating to question the "Briseis," Ep. iii., and to condemn the "Hermione" (viii.) with Lachmann. But perhaps they are somewhat sick of the German mania for doubting, disallowing, and docking; in which case they will the more readily acquiesce in Mr. Palmer's broad justification of the authenticity of the "Hermione," on the ground of its reflecting, as all Ovid's imitative compositions do, the conception of the source from which it was taken. As Ovid's Phædra is Euripides's Phædra over again, his Jason the Jason of Euripides, his Dido Virgil's Dido a little softened, so in the eighth epistle the reproduction of the pervading conception of the model—namely, the curse of an ancestral crime clinging to remote descendants—is the token of his genial and appreciative following of the Greek dramatist with a fidelity not obscured by his many facile touches, or his own special grace of rhetoric and artifice.

That Mr. Palmer will prove an admirable mentor to the tiro who essays a critical study of the *Heroides* is manifest from the sound estimate he forms of the *Codex Puteanus* as compared with the legion of other MSS. which give no help whatever; and from his admission of indebtedness to the recension of the best MSS. by Merkel, from the collection of Keil. It is also due to his critical faculty to award him the credit of more than one happy divination, which Madvig has hit upon independently, in the second volume of his *Adversaria*, published after Mr. Palmer's sheets had been printed. It is not to be expected that all his emendations and conjectures will win the approval of rival critics; and indeed there are some from which we should strongly dissent; but it is no small matter to find a work like the *Heroides* handled discriminatively and lovingly by a competent scholar who recognizes three paramount obligations—namely, (1) to avoid needless alterations; (2) to adhere as closely as possible to the best MSS.; (3) to take care that emendation shall be in keeping with Ovidian usage. Under such conditions, we may augur a revival of interest in a charming series of love-letters; and we can promise a rare treat of re-introduction to many who have long forgotten the "Sic ubi fata vocant" and the "Hanc tua Penelope" of their Third form days, and who do not dream that aught so finished and artistic lurks in the Epistles as the matter which they really enshrine. One or two of the primo beauties of these pieces have been presented afresh to our own mind's eye by some note or illustration of Mr. Palmer, and a few words about some of these may help to show the worth of the poet and of his annotator at the same time. One of the most charming epistles—that of Briseis to Achilles—has ever seemed to us so full of spirit, taste, and poetry, that even without Mr. Palmer's encouragement we should have rushed into rebellion against Lachmann's depreciatory estimate. What can be truer or more tender than the bond-maid's plea, in contemplation of a lawfully established rival in her hero's affections?—

Nos humiles famuleque tunc data pensa trahemus,
Et minuent plenas stamina nostra colos.
Exagitet ne me tantum tua, deprecor, uxor,
Quæ mihi nescio quo non erit aqua modo;
Neve meos coram scindi patiæ capillos,
Et leviter dicam, "hæc quoque nostra fuit."

a plea for little more than toleration, evincing a readiness like that of the *Nut-Brown Maid*, whom Mr. Palmer very appositely quotes in reference to this passage, to submit to almost all indignities for the sake of nearness to her loved one. In another couplet later on in the same epistle we recognize another subtle Ovidian touch, where Briseis prays to be sent as an envoy to persuade Achilles and melt his obstinacy. "It is a great matter," she says:—

Est aliquid collum solitis tetigisse lacertis,
Presentisque oculos admonuisse sinu.

i.e. "It is of great influence to touch the neck with familiar arms, and with the bosom to remind the eyes of a lover face to face." Merkel appears to have challenged the line from inability to comprehend it; but it seems to us very much what Ovid's experience might have dictated his writing; and here again Mr. Palmer is at hand with a parallel from Coleridge's *Generative*:—

And partly 'twas a bashful art,
That I might rather feel than see
The swelling of her heart.

In the 5th Epistle, from Cnæone to Paris, which is admirable in

* P. Ovidii Nasonis *Heroides*. XIV. Edited by Arthur Palmer, M.A., Fellow of Trinity College, Dublin. London: Longmans. Dublin: E. Ponsonby. 1874.

its treatment throughout, occur one or two passages which are or ought to be favourite "loci classici." That, for instance, about Paris's carving Ænone's name on the beeches and poplars (v. 21-8), where, however, we should hesitate to accept Mr. Palmer's preference for the less authorized reading of "nomen" for "carmen" in the line,

Hoc in rugoso cortice carmen habes,

on the score of "nomen" meaning an "entry," and belonging to the class of metaphors which he shows, often with much cogency, that Ovid borrowed from his legal experiences. But a still finer, though less often quoted, part of this epistle is the highly dramatic prophecy put into the mouth of Cassandra (115-20), a passage as grand in its place as that which perhaps inspired it in the *Agamemnon*. Two more such passages we shall draw attention to; the memorable enumeration of the arts attributed to witches in Hypsipyle to Jason (84-94), and the description of the Temple in the Grove at Colchis in Medea's epistle to the same gay deceiver (xii. 67-70). In the former passage we doubt whether Mr. Palmer does not embarrass the interpretation of v. 88, "Illa loco silvas vivaque saxa movet," by taking "viva" as proleptic, i.e. "calls stones into life." Surely it is as much a tax on magic arts to move natural rocks from their site as woods, and nearly as hard to do so as to endue them with life. In retaining in (v. 93) "Male queritur herbis," &c. instead of the forced and strained "Maga queritur herbis" (the reasons for conjecturing which Mr. Palmer gives, though he admits their insufficiency, in a candid footnote), we see an instance of the proverbial superiority of second thoughts. To the other passage,

Est nemus et piceis et frondibus ilicis atrum, &c. (xii. 67, &c.)

we draw attention simply as a description of the idea which a Latin poet conceived of a grove or plantation, and as a proof how closely Ovid followed the Greek poets from whom he took his plots.

Whilst glancing at beautiful passages in the *Heroides*, it may not be amiss to string together four or five memorable single lines, some at least of which may have influenced the muse of one of our own poets, who must have wooed Ovid in his Etonian youth. In a line of Phyllis to Demophoon, "Et cecinit nurestum devia carmen avis," the lonely bird may have given the first suggestion of the "moping owl" on Gray's "ivy-mantled tower"; and Briseis's brothers,

Qui bene pro patria cum patriaque jacent,

have called forth Mr. Palmer to the parallelism from the Bard,

Ye died amidst your dying country's cries.

Even more certainly did Ænone's boast (v. 86), "Sunt mihi quas possint sceptrum decere manus," supply a hint for the "Hands that the rod of empire might have swayed," and we feel very sure that keen examination might yield more such coincidences. A very pretty line in the Dido to Æneas (168), "Dum tua sit Dido, quodlibet esse feret," is unfairly compared with a more elaborate sentiment in the *Nut-Brown Maid*, for its beauty is in its natural simplicity; but in the interests of true poetry we thank Mr. Palmer for standing up for the Ovidian couplet descriptive of the Isthmus of Corinth in its integrity:—

Æquora bina sulis oppugnant fluctibus Isthmon,
Et tenuis tellus audit utrumque mare.—*Phædr. Hippol.* 105.

Will it be credited that a barbarian annotator proposed to read "claudit" for "audit"? On the other hand, it is a strain too severe for our digestive organs to swallow the reading which Mr. Palmer would force on us in the second line of the first epistle. We used to be content in boyhood with reading Penelope's opening as follows:—

Hæc tua Penelope lento tibi mittit, Ulyx;
Nil mihi rescribas. Attamen ipse veni.

The abruptness and directness of the sentences seemed to have the very form of Ovid, who in his *Medea* to Jason begins with an abrupt "At tibi Colchorum," and in his *Dido* to Æneas similarly rushes at once in *medias res*. But because Gronovius and Burmann could not let the text alone, and conceived the extremely roundabout idea that for "attamen" should be read "ut tamen," and that *ut* should connect the first verse with the second, we are asked to believe that Ovid meant to make Penelope say that she sent a letter to her wandering spouse, "not, however, in order to draw an answer from him" [nil mihi rescribas ut tamen]. Such a clumsy mode of expression is surely very unlike Ovid. Mr. Allen's suggestion, "fac tamen," will not mend the matter; and we can hardly doubt the instinct which bids us hug the old reading and punctuation.

The demand is less violent that in v. 40 of the same epistle we should exchange the rhyming pentameter anent Rhesus and Dolon (40)—

Utque sit hic somno proditus, ille dolo—

for a verse in which the last word "vigil" (suggested by an Eton master) fulfils the antithesis whilst it does away with the rhyme. But again, at vii. 45, although there the passage is of such admitted difficulty as to excuse imperfect attempts at a cure, however dubious, it is too much to ask us to accept the reading which is printed in the text before us, "Quid non censis inique?" and to admit the middle sense of "censis," if indeed it is a middle sense, which can be translated, "What do you not rate unfairly?" It is just to add that in his preface Mr. Palmer deserts "censis" for Madvig's conjecture, "Mentiris." In some cases, to our thinking, he goes astray from over-subtlety—e.g. where upon the construction of "revertendi liber" (i. 80) he sees more in it than

a genitive of reference, or "in respect of"; and still more so where, in v. 15, a hypercritical distinction is attempted between "super stramen, fœnoque," as the materials of the couch of Paris and Ænone, "explicable by the difference between straw and hay; the former being harder, a person lying upon it does not sink into it." It comes to this, therefore, we suppose, that the couch was of straw, but in the deep hay—a rather subtle refinement.

Let us not part with Mr. Palmer, however, without saying that this straw-splitting is very exceptional, and that very often he has hit the truth by a sagacious gift of criticism. Instances occur, which we have no room to particularize, at i. 102, "Hæc faciunt," ii. 100, "pelago vela negante data," and vii. 71-2, where he has very shrewdly and independently deduced from the obscure "Quid tanti est tutum merui" or "totum merui" of the MSS. a certain correction and obvious sense by the transposition of two letters, and reading "ut tum" in the place of "tutum." In one or two places also, notably in ix. 109-10, and in x. 52, he has really thrown considerable light upon ambiguous phrases by intelligent reference to the legal phraseology with which, as we have before remarked, Ovid's appointment as a triumvir capitalis and afterwards as a centumvir would make him acquainted. There is a larger number of misprints in the text of these epistles than consists with careful press correcting; but taking the book, all for all, we welcome it as an interesting and able contribution to the elucidation of a delightful poet, and sincerely hope to meet Mr. Palmer again in other departments of the same field.

CHRISTMAS BOOKS.

111.

LIFE on the Upper Thames, by H. R. Robertson. (Virtue, Spalding, and Co.)—There is very great merit in many of Mr. Robertson's illustrations of the scenery of the Upper Thames. His figure-drawing is perhaps the point where he is weakest. It is a pity therefore that as a frontispiece to this interesting volume he should have given an illustration in which a girl holding the tiller of a barge is the most prominent object. Any one who knows the scenery—and such scenery every one ought to know, at all events to some extent—will find many a pleasant memory called back to his mind of quiet hours spent in quiet spots on the banks or on the stream of the silver Thames. The accompanying letterpress is very inferior to the engravings. Nets are used on the Thames, and Johnson certainly gave a curious definition of network. Mr. Robertson, moreover, gives a picture of a net. Unless, however, it can be shown that Johnson in defining network had not only the Thames, but also the Upper Thames, in view, we cannot allow that his definition should have been dragged into Mr. Robertson's book. He might with as much reason have brought in Johnson's definition of outs because he has drawn a picture of two horses towing a barge, or of excise because men when hot with rowing cool their thirst with a tankard of ale.

Beauty in Common Things. Illustrated by twelve drawings from nature by Mrs. J. W. Whymper, with descriptions by the Author of "Life Underground." (Society for Promoting Christian Knowledge).—In this volume we have drawings printed in colours—the title-page says "colours," for, with Christian Knowledge, American spelling apparently is promoted—of some of the commonest among the plants. Mrs. Whymper has done her part of the work fairly well, and the descriptions are on the whole not inferior to the pictures. We can easily believe that such a work as this may tend to give an insight into the beauty that is to be found in the common things all around us by those who bring to them a cultivated eye. The first thing to do is to awaken attention and observation, and this such books as the one before us certainly do. The author is as weak as some other botanists in derivation. "The word hip or hep," he says, "is traceable to the Anglo-Saxon *hiop*, Norw. *hiupa* and *jupe*, a corruption from the Latin *jujuba*." These amateur etymologists, in the first place, think that all words are derived from the Latin; in the second place, if they do not find a Latin stem to hand, they do not hesitate to invent one.

How to Build a House: an Architectural Novelle, by E. Viollet-le-Duc. Translated by Benjamin Bucknall, Architect. (Sampson Low and Co.)—A treatise on architecture is not generally given in the form of a story. Nevertheless, if the author has found that he cannot otherwise get people to study a little for themselves the simple facts on which the comforts of a house depend, he has not done unwisely in imparting his knowledge in the form of a novelle. The framework of the story is simple enough. A young student "comes home from the Lyceum bringing with him proofs of a well-spent year. Every one congratulates him on his success, and predicts for him after his six weeks' repose an energetic recommencement of congenial labour, crowned by a brilliant career in the future." His holidays hang heavy on his hand, and his father sets him to scheme out a plan for a house that is to be built for his married sister. A proper plan is afterwards prepared, and the house is built, while information is given and suggestions are made as the building rises. The book is clearly and sensibly written, and might be studied with advantage by any one who is thinking of building. It would have been all the more valuable if a chapter had been added on house-draining and ventilation, for on the former of these two points Frenchmen have a great deal to learn, and Englishmen not a little.

Scribner's Monthly: an Illustrated Magazine for the People, conducted by J. G. Holland. (Scribner and Co., New York).—

This magazine, though it could not rank with the *Cornhill* or *Mar-millan*, would yet hold a fair place among English magazines of the second order. The account of "Two Visits to Oxford" is written in a very friendly and discriminating spirit, and is generally free from inaccuracies. The writer notices a difference between the streets of a University town in England and of one in the United States. "One has scarcely stepped into the streets of Oxford," he says, "before he meets numbers of well-behaved modest youths walking by twos and threes, not in droves, as students patrol the streets of an American town." In the account of Charles Sumner's Death a curious instance may be found—it is not noticed as curious by the writer—of the extraordinary publicity of American life. The writer, a friend of Mr. Sumner's, says that he placed "his friend, Major Poore, in charge of the first floor, and his colleague in charge of the second floor, that no one might be allowed to approach the sick-room whom they could prevent. Major Poore summoned to his assistance two of the Capitol police." In spite of these precautions, "from time to time, friends who would not be denied made their way to the room, but as far as possible they were restrained by the physician, who desired to keep the room quiet." The writer wished to have the patient informed of his hopeless condition. The physician replied, "He has but one chance in a thousand; to excite him would be to destroy that chance." "I then asked permission," the writer goes on to say, "to call in a clergyman; it was due to him, and the people who sent him here, that the voice of prayer should be heard in the house." We never before heard of the obligation of prayer being made to depend on the respect due to the clergyman and to those who sent the clergyman. America may be a good enough country to live in. Those who can afford it, however, would, we should imagine, get their dying done in Europe.

The Book of Sacred Song. With a Preface by the Rev. Charles Kemble, M.A., Rector of Bath. (Seeley, Jackson, and Halliday).—"At the request of one," says the editor, "whose name, were it given, would be sufficient guarantee for the soundness of the following selection of sacred poems, I have examined the manuscript, as it has been prepared for the press." In using the word "soundness," Mr. Kemble, no doubt, is considering the songs rather from a theological than a poetical point of view. There are not a few writers of sacred verses who are as sound as the Thirtynine Articles themselves, and about as poetical. We are glad to say, however, that this selection, when it is looked at from its less sound but perhaps not less attractive side, seems to have been made on the whole with judgment.

In *The Rifle and the Hound in Ceylon* and *Eight Years in Ceylon* (Longmans) we have reprints of two of Sir Samuel Baker's works. "I look back," he says in his preface to the former of these two works, "to the hunting of my younger days with unmingled pleasure." However unmingled may be the pleasure of wholesale butchery, the narrative of it nevertheless is apt to be a little dull, if not sickening.

Two Years in East Africa, by Emile Jonveaux. With maps and numerous illustrations; *The Hunter and the Trapper in North America*. From the French of Benedict Révoil, by W. H. Davenport Adams; and *Wrecked on a Reef: a True Story*. From the French of F. E. Raynal. With forty illustrations by A. de Neuville. (All published by Nelson and Sons).—Is there a change coming over the spirit of the French nation, and are they at last catching the Englishman's love for wandering? It is curious at all events to notice how many of the wildest books of adventure now come to us from France. These three books of travel which we have clasped together are all written by Frenchmen, and with a good deal of spirit. They would be found interesting by young people. We cannot but regret, however, that the charming simplicity of *Robinson Crusoe* is not relished by the lads of the present day as it was by their fathers. In the highly seasoned tales that are now served up year by year, with at least one startling escape for each page, the taste is lost for simple fare. These three books, however, are quite up to the average of modern stories. We notice that in the book on East Africa the translator tells us that he has rewritten "the chapter devoted to the capture of Magdala. He trusts," he goes on to add, "that in their present form the romantic adventures of the hero of this exciting narrative will be acceptable to English readers." We shall next be prepared to see MM. Erckmann-Chatrian's *Plébiacite* translated into German in a form that will be acceptable to the Prussian reader.

King and Commonwealth: a History of the Great Rebellion, by B. M. Cordery and J. S. Phillpotts, Head-Master Elect of Bedford School, formerly Fellow of New College, Oxford. (Seeley, Jackson, and Halliday).—This history is, on the whole, well and clearly written, and gives in a convenient form a great deal of interesting information. It will be found suitable not only for the student who has some examination for which to prepare, for whom it seems primarily to have been written, but also for the general reader.

The Shakespeare Birthday Book. (Hatchards).—In this little book one or two quotations from Shakespeare are given for every day of the year. If any one would take the trouble to learn by heart the few lines set for each day, he would, without much labour, have many a fine passage rooted in his memory. The author might, with a little trouble, have found many more quotations that were especially suited to particular days. The "Ides of March," for instance, and the "Feast of St. Crispin," invite most obvious quotations.

The Language of Flowers; or, Floral Emblems of Thoughts, Feelings, and Sentiments, by Robert Tyas, M.A., LL.D., &c. With coloured groups of flowers. (Routledge and Sons).—Dr.

Tyas speaks of flowers and trees, and their language, from the cedar tree that is in Lebanon, even unto the hyssop that springeth out of the wall; in other words, from "the piece of heather that Prince Frederick William of Prussia gave to 'our dear Victoria' (extract from our beloved Queen's book)," to the black-thorn, whose fruit is said to be largely used in making British port wines. Those who care to study the language of flowers will find in this book all that they can need.

Rhymes and Roundelays in Praise of a Country Life. (Routledge and Sons).—The selection of poems is judicious, the type is clear, the paper is good, and the illustrations, by Birket Foster, Harrison Weir, and other artists, are at all events not inferior to those which are generally met with in such a selection as this.

Much the same can be said of *Picture Poems*, also published by Messrs. Routledge. It contains a selection of poems, chiefly by living authors, and drawings by a large number of artists, engraved by Dalziel Brothers. Both poems and illustrations have, as we read in the preface, all appeared before, "the greater part of them in a *Round of Days* and *Wayside Poems*." The fact of both works being out of print certainly justifies, as the publishers say, the present issue.

Dawn to Daylight; or, Gleams from the Poets of Twelve Centuries. With above two hundred illustrations. (Warne and Co.).—The selection certainly covers a wide enough ground, beginning with Cædmon and Thorkelin, and ending with Owen Meredith and Dora Greenwell. The illustrations also are very numerous, though why *The Vanity of Human Wishes*, or, as it is called here, *Vanity of Ambition*, should be adorned with a picture of two soldiers, one on horseback and the other on foot, is not very clear. It would have been as well if a foot-note informed the reader whether either of them, and, if so, which of the two, represents Swedish Charles and which the bold Bavarian. The uniform and musket scarcely suit the time of Xerxes, so him we may exclude from our speculation.

Songs of our Youth, by the Author of "John Halifax, Gentleman." Set to music. (Daddy, Lister, and Co.).—The music is certainly not worthy of the songs. Some few of the airs are pretty enough, but in the greater part of both melodies and accompaniments we can find but little merit. The musician proper, for whom however the volume is not, we suspect, meant, would almost receive a shock from the consecutive fifths which are given on a golden background on the elaborate cover of the book. It is a pity that songs which are so pretty in themselves should not have found a more skilful composer.

Fairy Frisket; or, Peeps at Insect Life, by A.L.O.E. (Nelson and Sons).—We have no doubt that this little work will be as highly esteemed by young people as the earlier publications of this popular writer. By means of a fairy story, A.L.O.E. manages to give her small readers a great deal of information about the insect world. When natural history, fairyland, and a sound moral are all combined in one story, children ought surely to be content.

Nursery Rhymes, Tales, and Jingles. The Camden Edition, compiled by Mrs. Valentine. With four hundred illustrations. (Warne and Co.).—The time has, we should think, at length come when there should be a new recension of all the nursery rhymes, and the text should be finally fixed. Towards effecting this, Mrs. Valentine's work will be found to be a valuable contribution. She has, it would seem, collated many ancient works that bear on the subject, and has got together a very large number of rhymes and tales. She admits, however, too readily a change in the text, out of regard to an excess of refinement. We read, for instance:—

Robin the Bobbin, the big-headed Ben,
He ate more meat than fourscore men.

It was not to the size of Benjamin's head that the ancient poet drew the child's attention. It is not a big head that a hero needs who is to perform vast feats of eating.

Nursery Rhymes and Nursery Tales of England, collected by J. O. Halliwell. (Warne and Co.).—The collection is much the same as that given in Mrs. Valentine's book. Its popularity is proved by the fact that it is now in its fifth edition. Mr. Halliwell, in writing about one of the rhymes, says:—"Possibility will not be outraged by conjecturing the John Ball of this piece to be the priest who took so distinguished a part in the rebellion of Richard II." It is quite true, as he says, that "traditional pieces are frequently so ancient." Nevertheless, possibility is certainly outraged when a gun with its flint and stock is assigned to the time of Richard II.

Boons and Blessings: Stories and Sketches to Illustrate the Advantages of Temperance, by Mrs. S. C. Hall. (Virtue, Spalding, and Co.).—These stories are very unequally written; but, whether lively or dull, they all teach one lesson—the advantages, namely, of teetotalism. Of the worst of the stories we can at all events say they cannot do any harm, and may do some good. A sot does not deserve any very high order of writing, and he might do worse than read the tales entitled "The Drunkard's Bible" and "Digging a Grave with a Wine-glass." We have heard, by the way, an old proverb which says "There are more graves dug with the tooth than the tankard."

Opening a Chestnut Burr, by Rev. E. P. Roe, Author of "Barriers Burned Away." (Routledge and Sons).—The author of this American story says in his preface that he has "received considerable well-deserved criticism from the gentlemen of the caustic pen." If he has derived much advantage from their criticism, his former tales must have been bad indeed. In the present

tale he recounts at great length the conversion of a wicked man of the world by a beautiful country girl. The story is absurd, and the pictures which illustrate it are, if possible, worse. The author, we notice, in one passage describes a certain kind of grape as "the type of juicy steak among fruits."

Fairy Gifts; or, a Wallet of Wonders, by Kathleen Knox, Author of "Father Time's Story-Book." (Griffith and Farran).—This is a pretty little story-book, with many a puzzle in it for little folks to find out. Mr. Greenaway's illustrations are not unworthy of the tales; indeed some of his smaller woodcuts are unusually good.

Fleur-de-Lis: Leaves from French History, by Esther Carr. (Hatchards).—Miss Carr has made an attempt to write history in the best way in which it can be written for the young. She has taken four interesting episodes in French history, and has worked them out in considerable detail. She has met with tolerable success, and her book, no doubt, will be an agreeable change after Mrs. Mackham. Her style, however, is not altogether that in which "the young girls or children" for whom she writes would take much delight. She has, moreover, a tendency to overburden the memory by bringing in names quite needlessly. It would be well if all writers for the young would learn to use language that the young can understand. Let Miss Carr read to "a young girl or a child" the line in which she says that "that idea culminated in the absolute monarchy of Louis XIV.," and, first making quite sure that she understands her own English, next see what meaning the child has got out of it.

MINOR NOTICES.

M ROUSSELET'S book about India* is certainly, from an artistic point of view, a work of Oriental richness and magnificence. It is a large quarto volume, glowing in crimson and gold, and profusely illustrated; and the illustrations are not merely numerous, but of a very high character. It is seldom indeed that we meet with a publication which is so perfect in its way. The woodcuts are cleverly designed and well cut, and they are also carefully printed on suitable paper. In this country wood-engraving, one of the most delicate as well as most effective forms of art, has degenerated into a sort of tricky factory labour. Artists are employed to draw upon the wood designs which shall involve the least amount of skilful cutting; background and details are scamped or omitted; and the body of the piece is made up of cheap and coarse apprentice work. If any one wants to see what real wood-engraving is when entrusted to competent and conscientious artists, he should take a look at *L'Inde des Rois*, and observe the thorough texture of the pictures, the play of light and shade, and depth and variety of colour. The landscapes and architectural pieces are especially good. We may cite among the best such examples as Bhurtpore, the Palace at Ajmir, the Mausoleum of Agra, the Façade of the Palace at Gwalior, Barwa Sagar, the Citadel of Ourcha, and Bhopal; but many others might be mentioned. The figure subjects are not all of equal merit, and in some of them may be detected the theatrical vices of the Doré school; it must be said, however, that they are, as a rule, spirited and vigorous, and some of the groups of natives are exceedingly graphic. By merely turning over the pages we get a vivid impression of Indian scenes and types of the people. It is perhaps almost inevitable that in the case of such a book as this the literary part should be subordinate to the pictorial; but M. Rousselet's narrative is lively and intelligent, and worth reading on its own account.

As the Conference of Brussels is to be resumed or supplemented by one at St. Petersburg, we may expect another discussion of the usages of war, and those who desire to learn in an easy and interesting way the chief points of the controversy cannot do better than consult Mr. Edwards's notes† on the method and conduct of the German invasion of France, and the questions arising out of it. Mr. Edwards was one of the *Times*' Correspondents during the conflict, and an eye-witness of the actual application of modern usages of war. He gives a vivid and animated picture of the system of occupation followed by the Germans, and its consequences to the invaded population; and, without at all trying to tone down the severities of the conquering force, he seems to think that on the whole no wanton excesses can be laid to their charge. One suggestion which he makes is probably sound. It is known that the general story of the inhabitants of the invaded districts is that the Germans at first were not so bad, but that as the war continued they got worse. It is certain at least that later on there were more angry complaints on the part of the French. The explanation of this which Mr. Edwards suggests is that the first invaders were much feared, and every one was astonished and delighted to find that they were better than they were expected to be. Everything they wanted was supplied without too much resistance, and the French began to think that a German invasion was not such a very terrible thing after all. But after a time the second body of invaders arrived, and found the people getting very sulky. They had had enough of the invasion; their first fears were over, and they were just in the mood to give their visitors as much trouble as possible. On the other hand, the new comers

were probably irritated to find that what had been given liberally in the first instance was refused to them. And of course matters went on from bad to worse. Mr. Edwards is disposed to doubt whether the German laws of war will bear much modification, and he considers that some of the restrictions imposed on the freedom of civilians to take part in military operations are essential to their own protection. A valuable and interesting part of Mr. Edwards's work is the Instructions for the government of the Armies of the United States in the Field which were issued during the Civil War, and which are here given at full in an appendix.

It is not very often that a man publishes a book for the express purpose of demonstrating his own folly, though he may sometimes do it unconsciously. But, as far as we can make out, this seems to have been Mr. Lawson's* object in giving to the world the history of his absurd exploits at Blennerhasset, a co-operative farm not far from Carlisle. Mr. Lawson, who is brother to Sir Wilfrid, appears to be what our grandfathers called a humourist. He is fond of great ideas, and whenever he falls under the influence of one he is impatient to have it carried out directly to the fullest extent, in order that he may have his hands free next week to take up another. A few years ago, being already a teetotaler, he embraced vegetarianism, but failed to convert his neighbours. Then he took to co-operative farming, and as this practically meant his providing capital for other people to spend, he had, as soon as the system was understood, no difficulty in finding co-operators, though they would have nothing to say to his greens instead of beef. He got up a sort of village parliament at Blennerhasset, which held weekly meetings and passed resolutions as to how the farm should be managed, and Mr. Lawson's money distributed, and who should rule over them, as well as all sorts of personal disputes and village squabbles. This amused the philanthropist very much for a time, until he found that his best assistants were leaving him because they objected to be at the mercy of the rabble, and that everything was getting into confusion. He then endeavoured to correct the evil by pointing out to the village council that it had only advising powers, and some one said, "What's the good of voting if Mr. Lawson will not tie himself to do as we vote?" To this he thinks a good answer was, "Of course not, for you might vote all my money to those present." This is no doubt true; but then what of fraternal co-operation? Mr. Lawson, who seems to have known nothing of agriculture, and to have been always too much in a hurry to learn anything, thought that all the latest improvements could be introduced all at once on the farm; and the consequence was, as might be expected, that, what with one crotchet and another, he lost a good deal of money, and at the end of a few years discovered that he had had enough of farming. Under the heading "What our Neighbours thought of us" he gives letters from several correspondents who very candidly hint that they think him rather crazy, and probably they were not far wrong.

A series of brief, accurate, and intelligent biographical notices of the leading men in Germany at the present moment would certainly be opportune and welcome, but we are sorry we cannot compliment Mr. Strauss† on the execution of his task. His sketches are coarse, violent, and vulgar, and the temper in which he writes inspires the reader with distrust of the soundness of his information as well as the fairness of his estimates of public characters. Here is a sentence which may be taken as a sample:—"The cruelly disappointed feudal and black crew, in their fierce rage at being thus foiled in their vile reactionary plot, insulted both King and Chancellor, by proclaiming openly and aloud that the latter had forced his master's hand by a threat of instant resignation should his Majesty decline to grant the concession demanded. The story was of course a base lie, like most of the productions coming from that mint." Notwithstanding its defects, however, the book is not without a certain interest. There is a story in the notice of Prince Bismarck which, though not new, will bear repetition. An album in which Guizot and Thiers had already written was sent to him for his autograph. M. Guizot had led off with "Dans ma longue vie j'ai appris deux seules: l'une est de beaucoup pardonner, et l'autre de ne jamais oublier." "Un peu d'oubli," suggested M. Thiers, "ne nuit pas à la sincérité du pardon"; to which Bismarck added, "J'ai appris dans ma vie à moi de beaucoup oublier, et de me faire beaucoup pardonner"—a touch of meekness not without humour.

Powerful and vivid as are the letters of Junius, comparatively little interest would probably now be taken in them were it not for the mystery, perhaps we may say the impenetrable mystery, which still surrounds their authorship. We have here a very neat, convenient, and complete edition‡ of the famous letters, with a collection of other writings supposed to be by the same writer, and numerous notes intended to elucidate the problem. There is a preface which gives an impartial summary of the various theories as to the identity of the writer without adopting any of them, and there is a "Preliminary Essay" in which the claims of Lord George Sackville are strongly recommended to consideration. Facsimiles are given of the handwriting of the private and public letters of Junius, and of the various persons with whom attempts

* *L'Inde des Rois: voyage dans l'Inde centrale, et dans les Présidences de Bombay et du Bengale.* Par Louis Rousselet. Ouvrage contenant 317 gravures sur bois et six cartes. Paris: Hachette et Cie.

† *The Germans in France.* By H. Sutherland Edwards. London: E. Stanford.

* *Ten Years of Gentleman-Farming at Blennerhasset, with Co-operative Objects.* By William Lawson, C. D. Hunter, and others. London: Longmans & Co.

† *Men who have Made the New German Empire: a Series of Brief Biographic Sketches.* By G. Strauss. 2 vols. London: Tinsley Brothers.

‡ *Junius.* Including Letters by the same Writer, under other signatures (now first collected). To which are added his Confidential Correspondence with Mr. Wilkes, and his private Letters addressed to Mr. H. S. Woodfall. With a Preliminary Essay, Notes, &c. London: Routledge & Sons.

have been made to identify him. With this volume in his hands, anybody who wishes for a little intellectual recreation can study the question for himself. If he fails to find any solution to his satisfaction, he will at least have obtained some amusement.

Mr. Wegg-Prosser has translated from the French some letters* describing the Italian attacks on Rome in 1867 and 1870. They are written in a strong Ultramontane tone, and are intended to show that Garibaldi is not only a wicked revolutionist and incompetent general, but is deficient in personal courage.

In a modest preface Mr. Brown introduces us to a rather ambitious work.† He has endeavoured to compress into less than four hundred pages the whole law of England, and has evidently bestowed much pains on the execution of the task. He does not, however, aim at anything higher than rendering a service to students preparing for the Bar or for the lower branch of the profession, and there can be no doubt that he has produced a book of reference which will be useful to the class he has had in view. The conditions which are imposed by the very nature of such a work necessarily limit the possibility of making it altogether satisfactory. If it goes thoroughly into the rules and principles of every branch of law, it becomes too bulky to answer the purpose for which it is composed; and, on the other hand, there is the danger of sacrificing completeness to compression. Mr. Brown has perhaps done about as much as any one, not a rare genius, could do in such a case, and his Dictionary, which is at least more handy and portable than Wharton's, will be serviceable to those who are in want of hints and references, and are content with a general idea of a law or legal principle. But he is constantly pulled up by the necessity of brevity, and has to dispose of large subjects in two or three sentences. We may take the heading "Conspiracy" as an illustration of what we mean. Conspiracy is defined as an agreement between two or more persons "(1) falsely to charge another with a crime punishable by law, either from a malicious or vindictive motive or feeling towards the party, or for the purpose of extorting money from him; or (2) wrongfully to injure or prejudice a third person, or any body of men, in any other manner; or (3) to commit any offence punishable by law; or (4) to do any act with intent to prevent the course of justice; or (5) to effect a legal purpose with a corrupt intent, or by improper means." It will be seen that this is a rough and inadequate account of a very delicate and subtle law; but it is perhaps as much as can be expected in a few lines. "Wrongfully to injure or prejudice a third person" is in itself a definition which requires to be defined; and the same may be said of "a corrupt intent" or "by improper means." A reference to some of the leading cases would have been valuable, but then that would have taken up more space than could be spared. On the whole, students will probably find that they will make more speed in the long run by going to the special text-books on any subject which they wish to understand than by referring to the Dictionary; but at the same time it is a handy book to have at one's elbow, if it is only taken for what it is worth.

As Mr. Deane's work‡ is addressed to the rising generation of conveyancers, "students entering upon the difficulties of real property law," it may be presumed that he does not fear the immediate annihilation of that noble science in its traditional forms by any legislative changes. The first part of the volume is composed of a series of chapters on corporeal hereditaments, and the second part of some lectures on conveyancing recently delivered by the author at the Law Institution. It is enough to say that Mr. Deane writes clearly and to the point.

From the appearance of a second edition of Messrs. Vandervell and Witham's manual§ on skating it may be inferred that the subject is one in which many persons take an interest, and on which the writers of this work are accepted as authorities. Skating, it seems, is not more exempt than other great arts from the revolutions of fashion. The old school of skaters would, we are told, "bury the inside in oblivion, and be content with a few picked movements," while the modern school wishes to see "the inside brought into use for figuring, and a host of pure one-footed and difficult feats of balancing added to the old glories of the art." The authors of this little volume are enthusiastic champions of the new school, and strongly advocate the claims of the "inside," while also insisting on "the great value of the spiral figure and the serpentine line, coupled with the semi-sideways position of the body." They admit that, as at present practised, outside skating is the more graceful of the two, but they suggest that inside skating may be made more beautiful by giving it "that semblance of danger from falling which is the charm of the outside." This is to be done by placing the unemployed leg out of the way in the rear. The apparently increasing mildness of English winters renders the question of artificial ice, or of some substitute, exceedingly important to skaters. It is remarked that, for a substitute, "perhaps a composition of the nature of hard soap, and wooden skates, with a wooden slip instead of the ordinary iron, might answer, but the tumbling down would be rather unpleasant," as we should think it would. The writers are more favourable to roller-skates, on which, they say, a great variety of combina-

tions of movements may be made. They explode with some indignation the myth of cutting out a name on the ice, declaring that it is simply impossible to be done by pure continuous skating. "High art" in skating is defined to consist in balancing the body steadily on one foot in a perfect attitude, fresh impulse being obtained by a change of feet at pretty long intervals.

Mr. Tolhausen, having compiled a dictionary of technical terms in French, German, and English, has now put forth an edition* in English, German, and French, which is to be followed by another in which German will stand first. It is needless to say that this is an exceedingly useful kind of work, as it supplies information in which the ordinary dictionaries are usually deficient; and, as far as we can judge by dipping into it here and there, it seems to have been prepared with much research and care.

Mr. Higginbotham's Indian biographies† have reached a second edition in an enlarged and amended form. The biographies are given in dictionary order, and contain a good deal of interesting information, though occasionally they rather degenerate into gossip. It may be noted, as evidence of a certain want of system in the book, that whilst Bernadotte, who was only for a short time in India as a sergeant, has a biography, and Mr. Chisholm Anstey is also treated at full length, there is no notice of Macaulay's Indian career. Biographies of men still in India are purposely omitted.

Mr. Page has collected into a volume‡ a number of sketches which belong to a useful and important branch of biography—that which portrays the lives of men who, without attaining to the highest eminence, or filling very conspicuous public positions, distinguish themselves by their energy of character and devotion to the objects they pursue. The group represented in this volume includes Bishop Patteson, Charles Knight, Robert Chambers, Duncan Matheson, the soldier's friend, Sir IL. Lawrence, Dean Alford, and others. Mr. Page has happily avoided the didactic style, and his sketches are equally interesting and thoughtful. There is much genuine philosophy in this unpretending volume.

Mr. Becker's historical notices§ of the Royal Society, the Royal Institution, and other scientific Societies of London are carefully written, but strike one as rather meagre and deficient in substance.

Mrs. Kitchener, who has had her husband's assistance in the preparation of her little volume||, has provided a very clear and readable handbook of botany, which is equally adapted for personal use and class teaching. The author has avoided technical terms as much as possible, so that her work may be studied without difficulty by a beginner.

Mr. Helmore, having undertaken to write a manual of instruction which would help stammerers to cure themselves, found that his work¶ naturally assumed such a wide range that it was adapted not merely for stammerers, but for all who desired to enjoy free action of lung and fluency of speech. There are certainly many persons who suffer from no physical impediment, but yet, from a bad habit, or defective education, speak very imperfectly, and Mr. Helmore's directions and exercises are therefore of general interest.

* *Technological Dictionary in the English, German, and French Languages.* Edited by Alex. Tolhausen; revised by Louis Tolhausen. Leipzig: N. Tauchnitz. London: Sampson Low & Co.

NOTICE.

We beg leave to state that we decline to return rejected Communications; and to this rule we can make no exception.

THE SATURDAY REVIEW

OF

POLITICS, LITERATURE, SCIENCE, AND ART.

Price 6d.

CONTENTS OF No. 598, DECEMBER 12, 1874:

Prince Bismarck and his Enemies.
President Grant's Message. Stroud.
Russian Designs on Turkey. University Education and the French Assembly.
Agricultural Politics. Parties in France. The Navy.
The Dramatic Censorship.

The Transit of Venus. A New Fable of the Bees.
Mons. Sacer. Amateur Nursing. Clerical Meetings, Past and Present.
The Shah's Diary. The Old Catholics and their Panegyrista.
Cattle Shows.

Social Pressure.
Two Books on Political Economy. Landscapes, Churches, and Moralities.
A Lost Chapter in the History of Mary Queen of Scots Recovered.
A New Origin of the English. Linley Rochford.
Palmer's Ovid. Christmas Books—III.
Minor Notices.

* *Rome and her Captors.* Letters collected and edited by Count Henri d'Iderville, and translated by F. R. Wegg-Prosser. London: R. Washbourne.

† *A New Law Dictionary and Institute of the whole Law.* By Archibald Brown. London: Stevens & Haynes.

‡ *Principles of Conveyancing: an Elementary Treatise for the Use of Students.* By Henry C. Deane.

§ *A System of Figure-Skating.* By H. E. Vandervell and J. M. Witham. Second Edition. London: Horace Cox.

CONTENTS OF No. 937, DECEMBER 5, 1874:

Russia and the New Conference—Current Politics—Marshall MacMahon's Message—Mr. Rathbone on Local Government—Alaco-Lorraine—National Defence—The Canadian Reciprocity Treaty—The Duke of Argyll and the Scotch Patronage Act—Stage Decorum.

Greece in Italy—Dog Shows.—St. Paul's Unconquered—Advice to Young Housewives—Dartmoor—Starring at the Abbey—Revolutionary Catholic Pastors—Dr. Kenney—Cruelty at Sea.

Street's Brick and Marble in Italy.—Professor Mackon's Christianity.—The Berlin History of the Civil War in America—Egypt and Ireland—Scenes of Russian Life—Horn's Ancient Terms and Measures of Land—In Honour Bound—Christmas Books. II.—French Literature.

London: Published at 38 SOUTHAMPTON STREET, STRAND, W.C.

ADVERTISEMENTS.

DORÉ'S GREAT PICTURE of "CHRIST LEAVING the PRÆTORIUM," with "Dream of Pilate's Wife," "Night of the Crucifixion," "Soldiers of the Cross," "Christian Martyrs," &c.—**DOLÉ, GALLERY**, 35 New Bond Street. Ten to Six. Brilliantly lighted at dusk and on dull days. Admission, 1s.

ELIJAH WALTON'S PAINTINGS (Eastern, Alpine, Welsh, &c.) EXHIBITION, including Mr. Walton's Work during 1873 and 1874, now OPEN at Burlington Gallery, 101 Piccadilly. Ten till Dusk.—Admission, with Catalogue, 1s.

WELSH SCENERY. By **ELIJAH WALTON**.—The Original Drawings of WELSH SCENERY, and a number of Alpine Drawings, are now added to the above Exhibition of Mr. Walton's Works.

THE ARUNDEL SOCIETY'S FACSIMILES in COLOUR from the OLD MASTER'S are Exhibited Free to the Public, Daily, and Sold from 10s. to 50s. each. Descriptive Lists sent, post free, on application to 21 Old Bond Street, London, W.

UNIVERSITY OF LONDON.—The following are the Dates at which the several EXAMINATIONS in the UNIVERSITY OF LONDON for the Year 1875 will commence:

<i>Matriculation</i>	Monday, January 11, and Monday, June 24.
<i>Bachelor of Arts</i>	First B.A., Monday, July 19.
	Second B.A., Monday, October 25.
<i>Master of Arts</i>	Branch I., Monday, June 7; Branch II., Monday, June 11; Branch III., Monday, June 21.
<i>Doctor of Literature</i>	First D.Lit., Monday, June 7.
	Second D.Lit., Tuesday, October 19.
<i>Scriptural Examinations</i>	Tuesday, November 2.
<i>Bachelor of Science</i>	First B.Sc., Monday, July 10.
	Second B.Sc., Monday, October 25.
<i>Doctor of Science</i>	Within the first Twenty-one days of June.
<i>Bachelor of Laws</i>	First L.B., Wednesday, January 6.
	Second L.B., Thursday, January 14.
<i>Doctor of Laws</i>	Thursday, January 14.
<i>Bachelor of Medicine</i>	Preliminary Scientific, Monday, July 19.
	First M.B., Monday, July 26.
	Second M.B., Monday, November 1.
<i>Bachelor of Surgery</i>	Tuesday, November 2.
<i>Master in Surgery</i>	Monday, November 22.
<i>Doctor of Medicine</i>	Monday, November 22.
<i>Examination for Women</i>	Monday, May 3.

The Regulations relating to the above Examinations and Degrees may be obtained on application to "The Registrar of the University of London, Burlington Gardens, London, W." December 10, 1874. **WILLIAM B. CARPENTER, M.D., Secy. &c.**

SOCIETY for the ENCOURAGEMENT of the FINE ARTS. SEVENTEENTH SESSION.

FIRST CONVERSATION, Thursday, January 15, 1875, at the Society of British Artists' Gallery, Suffolk Street.

Four Conversations, Lectures, Exhibitions, &c.—Thursday Evenings.

Annual Subscription, 1 Guinea. No Entrance Fee.

AUGUSTUS G. BABINGTON, Hon. Secretary.

9 Conduit Street, Regent Street, W.

MALVERN COLLEGE.

This College contains two Departments: the CLASSICAL and the MODERN. There is also a preparatory LOWER SCHOOL.

There are Boarding-Houses within the College Grounds, held by the Head Master and others of his Staff; a Gymnasium, &c.

Board and Tuition under Fourteen, £80; over Fourteen, £90. Non-Scholarholders pay an extra Fee of £5. Special advantages for Sons of Clergymen and Home Boarders.

For further information, apply to the Rev. ARTHUR FARRER, M.A., Head-Master, late Fellow and Tutor of New College, Oxford.

The Examination for Scholarships and Exhibitions on December 22 and 23.

MALVERN COLLEGE.

THE ANNUAL EXAMINATION for SCHOLARSHIPS and EXHIBITIONS will be held on December 22 and 23. There will be awarded Six House Scholarships of £50, Four Founders' Scholarships of £50, and some Exhibitions of £30. The Awards will be for one, or for two years, according to merit, in Classics or Mathematics. For particulars apply to the HEAD-MASTER.

ELIZABETH COLLEGE, GUERNSEY.

Vice-Chancellor—The BISHOP of WINCHESTER.

Valuable University Scholarships and College Exhibitions for annual competition. Special attention paid to Modern Languages and the Preparation of Candidates for Woolwich, Cooper's Hill, Control Department, Army and Navy, and Civil Service.

Next Term begins February 1, 1875.

OPEN SCHOLARSHIPS.—DULWICH HOUSE SCHOOL.

OLNEY HILL, S.E. There will be an EXAMINATION during the Christmas Vacation for THREE OPEN SCHOLARSHIPS for Sons of Gentlemen, under Fifteen years of age, about to enter the School. The Scholarships are of the annual value of £20 each, and tenable during the period of the Student's residence. Special arrangements for Candidates at a distance.—For particulars apply to the HEAD-MASTER.

THE COLLEGE SCHOOL, Stratford-upon-Avon.—THREE

SCHOLARSHIPS, One of £50 a year and Two of £40, tenable for Three Years at this School, will be offered for Competition, on December 19, at Ten A.M., open to all Boys not yet members of the School, under Fourteen years of age, January 31, 1875. Candidates will be lodged in the College House.—Apply to the HEAD-MASTER, or to the Rev. Dr. COLLIER.

SCHOLARSHIPS.—AN ELECTION to FOUR ENTRANCE

SCHOLARSHIPS, Two of £50 a year, One of £30, and One of £20, will be held on Wednesday, April 21, 1875.—Apply to the BUNSON, Hatfield College, Abingdon.

BRIGHTON COLLEGE.

The Lord Bishop of CHICHESTER. The Lord LECONFIELD.

The Duke of DEVONSHIRE. The Marquis of BRISTOL, &c.

President.—The EARL of CHICHESTER, Lord-Lieutenant of Sussex.

Principal.—The Rev. CHARLES BIGG, M.A., late Senior Student and Tutor of Christ Church, Oxford.

Brighton College offers a liberal education for the Sons of Noblemen and Gentlemen.

The Classical Division is that usual in public schools, having in view the requirements of the Universities and of the learned professions.

The Modern Division has been organized with great care, and provides a thorough liberal and practical education for Boys intended for business or the active professions.

There is a good laboratory and a well-fitted carpenter's shop, both superintended by qualified instructors.

The College is situated in the healthiest part of Brighton, the school-rooms are large and well ventilated, and there is an excellent playground. The climate is peculiarly favourable to Boys of delicate constitution.

The College is endowed with fifteen Scholarships, some tenable during the Pupils' school career, others enabling the student to proceed to either of the Universities.

The NEXT TERM commences on January 19, 1875. Terms for Boarders 50 to 90 guineas per annum, according to age. The Sons of Clergymen, 60 to 70 guineas. For Non-boarders the fees are from £25 to £35 per annum.

For further particulars address the SECRETARY of the Brighton College, Brighton.

THE UNITED SERVICES PROPRIETARY COLLEGE.

Limited, Westward Ho (on the N. Devon Coast).

101s Grace the Duke of NORTHUMBERLAND, D.C.L.

His Grace the Duke of WELLINGTON, K.G.

The Most Hon. the Marquis of TWYFORD, K.T., G.C.B.

The Right Hon. the Earl of LAUDERDALE, G.C.B.

The Right Hon. Lord STRATHNAIRN, G.C.B., G.C.S.I.

The Right Hon. Lord NAPIER of MAGDALA, G.C.B., G.C.S.I.

And many distinguished Officers of both branches of the Service.

Chairman of Council.—Major-General Sir H. C. B. DAUBENEY, K.C.D.

Head-Master.—CORNELL PRICE, M.A., B.C.L., late Master of the Modern Side, Haileybury College.

Second-Master.—F. W. HASLAM, B.A. (First Class Classical Tripos, 1871).

The School, opened with 60 Pupils on September 10; upwards of 50 additional names are on the waiting list.

A Senior Department is attached to the School for the preparation of Candidates for the various Military and Civil Services. Boys direct from a Public School, who can bring strong testimony to character, are admissible.

For further particulars address the SECRETARY or the HEAD-MASTER, Westward Ho, N. Devon.

ABINGDON SCHOOL (Six miles from Oxford).—An Old

Foundation, with University Scholarships, having new Buildings and extensive Grounds. There are Classical and Modern sides, and a Public School training is given on moderate terms.—For particulars, and admission in January, apply to Rev. E. SOMERSET, Head-Master.

NAVAL CADETSHIPS, &c.—"EASTMAN'S"

R.N. ACADEMY, SOUTHSEA.

In November 1873, and November 1874, One-Third and One-Fourth respectively of the Successful Competitors for Naval Cadetships passed from "Eastman's." Pupils are received from Nine years of age upwards.

WOOLWICH, ARMY, COOPER'S HILL.—MORGAN

JENKINS, M.A. (Wrexham), assisted by an able Staff of Graduates in First-Class Honours (including a Second in First-Class of Natural Science Tripos), prepares Resident and Non-Resident PUPILS for the above. Four out of six went up for Cooper's Hill, the only one for Woolwich, and three out of four for the last June Examinations have passed.—Address 50 Cornwall Road, Westbourne Park, W.

FOLKESTONE.—Mr. W. J. JEAFFRESON, M.A. (Scholar)

Oxon, assisted by a Cambridge Honorary-Man and other competent Teachers, prepares for the Universities and for all Competitive Examinations. Pupils successful at the last four Examinations for First Appointments. Vacancies at Christmas.

CONTINENTAL.—Special Preparation for the ARMY, UNI-

VERSITIES, &c. Dinard, Brittany. The ENGLISH CHAPLAIN, having very successfully prepared Candidates for the above, has now a few VACANCIES.—Address, Maison Ikrit, Dinard (Ille-et-Vilaine), France.

EDUCATION for BOYS, free alike from Clerical and Dissenting

influences, in the Family of a Layman, a CAMBRIDGE M.A. of much Experience, Ages Eight to Fourteen. Terms high.—Address, THROCKMORTON, at Messrs. Kerby & Eadeau's, Publishers and Bookellers, 100 Oxford Street.

ARMY DIRECT, CONTROL, and WOOLWICH.—Rev. Dr.

HUGHES Wranz, Cam., who during the last Twenty Years has passed Three Hundred, has VACANCIES. Ample Assistance in Surveys, Classics, &c.—Castlebar Court, Ealing, W.

AN OLD RUGBEIAN, Cambridge Classical Honour Man, who

receives Two PUPILS, will have ONE VACANCY after Christmas. Terms, £200.—Address, VICKAR, care of Steel & Jones, Advertising Agents, Spring Gardens, S.W.

TO MILITIA OFFICERS and CANDIDATES for "COM-

PETITIVE EXAMINATIONS.—Captain CHAWNER (late 7th Regiment) will have THREE VACANCIES after the December Examinations. Terms on application, and references.—The Manor House, Newton Valence, Alton, Hants.

OVERSLADE, near Rugby.—A first-class PREPARATORY

SCHOOL, under the Rev. G. F. WRIGHT, M.A., late Fellow of Corn. Coll. Camb., and formerly Assistant-Master at Shrewsbury School and Wellington College.

DELICATE or BACKWARD BOYS.—A GRADUATE

(Married) of Trin Coll. Camb., an old Rugbeian, has TWO VACANCIES for his next Term. He offers Classes, Mathematics, French, and German—a very superior house, and every care and comfort for delicate Boys; and if desired, Shooting, Fishing, and Hunting. Terms, 150 to 200 Guineas.—Address, Rev. H. L. L., Holgate Rectory, Much Wenlock.

BRIGHTON.—Miss HANHART, successor to Miss BLUNDELL

and Miss DUNN, will have, after Christmas, a few VACANCIES in her SCHOOL for YOUNG LADIES. Highest references.—Stanford House, Eaton Place, Brighton.

A PHYSICIAN wishes to RECOMMEND the LADY who

Fluently speaks French.—She receives Twelve PUPILS, and has TWO VACANCIES after Christmas. Situation healthy, twenty miles from London. French and German Resident Governesses. Educational advantages great. First-rate London Masters. Home comforts and moral training exceptionally good.—For terms, &c., apply, to M.D., 25 Cavendish Square, London.

HEAD-MASTERSHIP.—BEDFORDSHIRE MIDDLE-

CLASS PUBLIC SCHOOL COMPANY, LIMITED.

Mr. EDWARD ELIAS MORRIS, M.A., of Lincoln College, Oxford, the Head-Master, has tendered his Resignation on receiving the Appointment of Head-Master of the Grammar School, Melbourne, Australia. The Directors therefore REQUIRE a HEAD-MASTER.

The School, which is in the Parish of Kempston, and within a mile of Bedford, is fitted for 200 Boarders, and has at present 150.

Candidates to communicate with the SECRETARY, and furnish copies of their Testimonials on or before Monday, December 14 next.

Candidates must not be above 16½ years of age.

Salary £500 per annum, and a Gratuity Fee of £1 for every Boy over the number of 150, besides free rent, rates, and taxes.

6 St. Paul's Square, Bedford, Beds. **THOS. W. TURNLEY, Secretary.**

TO GRADUATES in HONOURS and OLDERGYMEN.—

A CLERGYMAN desires, on account of ill Health, to DISPOSE of the LEASE of a Seventeen-roomed HOUSE at Upper Norwood, the Furniture, and his Connection with a College, such Connection consisting of the privilege of Boarding the Resident Students. The position presents a very favourable opening for a Private Tutor preparing Pupils for Cooper's Hill and the various Professional Examinations.—For particulars, address M.A., Messrs. Syme & Son, Solicitors, 7 Finsbury's Inn, E.C.

WANTED, a PARTNERSHIP in a well-established NEWS-

PAPER.—Address, in confidence, K. T. Mr. J. T. Nalder, Vyse Street, Birmingham.

OLD ENGRAVINGS.—WANTED to PURCHASE a few by

Callot. State all particulars, condition, and price to Captain R., care of Messrs. Blad & East, corner of Abchurch Lane, King William Street.

HYDROPATHY.—SUDBROOK PARK, Richmond Hill.

Physician—Dr. EDWARD LANE, M.A., M.D., Edin.

For Invalids and those requiring rest and change. Turkish Baths on the premises.

BRIGHTON.—BEDFORD HOTEL.—Facing Sea and

Esplanade. Near the West Pier. Central and quiet. Long established. Suites of Rooms. Spacious Coffee-room for Ladies and Gentlemen. Sea-Water Service in the Hotel.

ROBERT PARK, Manager.

WINTER at the URANVILLE.—Replete with Home comfort.

Hydropaths, Turkish, Ozon, Saline, Plunge, and Medical Baths. Billiard and Concert Rooms. American Bowling Alley. Beautiful Views, Sea and Shipping. Table-d'hôte 6.30 P.M.—Address, THE MANAR, St. Lawrence-on-Sea, Hants.

CLIFTON.—The most healthy place in the United Kingdom.

Average Annual Mortality Rate, 13 per 1,000. ST. VINCENT'S ROCKS HOTEL, facing the Suspension Bridge. The best situation in Clifton. Moderate Boarding Terms for the Winter.

J. DAVIES, Manager.

CHRISTMAS PRESENTS and NEW YEAR'S GIFTS.—

WATCOMBE TERRA-COTTA ART MANUFACTURES. The Company have in stock at their Depot, 309 Oxford Street, W., Works of Art of great beauty, and many Choice Novelties suitable for Presents.

Works: Watcombe, near Torquay.

PRINCE BISMARCK'S FOREIGN POLICY.

AS the decision of the Court before which Count ARNIM is being tried has not yet been made known, any discussion of the case as presented to the tribunal would be premature. It is true that his conduct as a diplomatist is not technically before the Court; but it is not much comfort or protection to a person accused if outsiders tell him that they cannot say whether he is legally guilty, but that his general line of conduct has been morally deplorable and professionally discreditable. During the course of the proceedings, however, some important and interesting despatches from Prince BISMARCK have been published which are a very valuable contribution to the recent history of Europe; and their worth and significance may be considered apart from the trial by which they have been elicited. In order, however, to hold the scales evenly, it is necessary to put aside the questions whether Prince BISMARCK is now justified in allowing those despatches to be published, whether Count ARNIM departed from his proper functions, whether he was wise, in what he wrote and in the way in which he wrote, and whether the mode in which Prince BISMARCK addressed him was or was not becoming or deserved. We may for the moment look on the policy sketched in Count ARNIM'S despatches as a policy which Germany might have pursued, and on the policy sketched in Prince BISMARCK'S despatches as a different policy which Germany actually pursued. It is not saying anything unfair against Count ARNIM to say that his policy seems, if we regard both from a German point of view, less vigorous, wise, and bold than the policy of his official chief. The German Liberal papers are full of admiration for the policy which Prince BISMARCK adopts, and it is not wonderful that this should be so. Prince BISMARCK had distinct ends, and pursued them with unremitting perseverance and with a singular penetration into the realities of the situation in which he found himself. A careful perusal of his despatches will show, we think, that the ends he pursued were the securing the payment of the indemnity, abstention from interference in the internal affairs of France, and the preservation of the peace of Europe. From the point of view of a German statesman, these ends were undoubtedly ends which it was eminently desirable to attain; and now that we know some of the more important details of the policy he adopted, we are able to see how steadily he kept these ends in view, and how clearly and sagaciously he estimated the means by which he could best effect what he desired.

Prince BISMARCK'S views as to the course to be taken in order to secure the payment of the indemnity must necessarily be taken in conjunction with his views as to non-interference with France. For Count ARNIM thought that to interfere in the internal affairs of France was the secret of getting the indemnity paid. He urged that Germany, while its troops were still holding the conquered territory, could practically decide what the form of government in France should be, and that, while any Government would be willing to pay the indemnity if it could, yet the superior solidity of a monarchical Government would most surely enable France to find the requisite money; while its affinity with the form of government established in Germany would conduce to the maintenance of friendly relations between the two countries, and would tend to repress whatever elements of democratic disaffection might exist in Germany. He was not much inclined to one

monarchical party more than to another, and after he saw the chances of the BOURBONS dwindling away, he was for extending favour to the BONAPARTES. Of M. THIERS he expressed a hearty dislike and distrust, regarding him as the main obstacle in the way of the consolidation of that form of government which he considered most advantageous to Germany. Prince BISMARCK entirely dissented from this view. He said that M. THIERS might be trusted to pay the indemnity, but that it was by no means clear that the same could be said of a monarch seated on a very shaky throne. Prince BISMARCK, who always looked on European politics as a whole, which Count ARNIM never did, asked himself what would happen if a French monarch were placed on the throne. Vienna would begin at once to bestir itself, and possibly St. Peter-burg might take the same line. Friendly, unpleasantly friendly, entreaties would be made to show the new monarchy a little reasonable indulgence, to give it time, and not press too rigidly for any money that might be due. Germany, if it insisted on its pound of flesh, might thus find itself under the disagreeable necessity of having to deny the requests of Powers with which it wished to stand well. Nor did Prince BISMARCK at all agree with Count ARNIM in thinking it of importance to the German monarchy that France should be under a monarchy too. The Germans were not affected by what other countries might choose to do. They saw the advantage of a monarchy for themselves, and recent events had only made them more attached to it. Experience had shown that every French Government, whether monarchical or not, had tried to coquet with democracy in other nations, and a French monarch would be as ready to profit, if he could, by the internal differences of Germans as the President of a French Republic. The only French Government that could do any real harm to Germany was a Legitimist one, as it would strengthen the Ultramontane enemies of the German Empire. But Prince BISMARCK entirely declined to interfere with France even if it chose to take back HENRY V. The French might do as they pleased about their Government provided that they paid the money they owed, and M. THIERS was the man on whom the greatest reliance for the payment of the money could be placed. Events have abundantly justified Prince BISMARCK. M. THIERS did manage to get the indemnity paid, and to get it paid long before the final instalments were due. That he, and he alone, could have done this, was the opinion of the French Assembly and of the French nation; and it was only when he had done this indispensable work that his enemies took measures to show their gratitude by turning him out of office.

For the preservation of peace Prince BISMARCK trusted to his alliance with Austria and Russia. He wished neither to meddle nor to permit meddling in little things which might lead to a rupture. That the French would equally under every Government try their luck in a war of revenge was, he held, too clear to admit of any reasonable doubt. But as long as France was without allies she was not at all formidable. The true way to keep the French quiet was to make them feel that Germany was too strong for them to attack single-handed. *Oderint dum metuant* was Prince BISMARCK'S simple maxim. He entreated, or, perhaps it ought to be said, ordered, Count ARNIM to attend to great things, and to make little of small things. The greatest of things to attend to was the Russian alliance, and in dealing with Prince ORLOFF, the new Russian Ambassador at Paris, Prince BISMARCK thought that Count ARNIM should bear in mind that Prince ORLOFF, "being a patriot," would

never forget the importance of the alliance of Germany to Russia, and that Count ARNIM might therefore view with indifference the arts and manœuvres of French society to make Prince ORLOFF seem specially friendly to France. It was only those who could grasp the true foreign policy of Germany in its widest bearings that were competent to have anything to do with it, and Prince BISMARCK accordingly expressed great surprise at Count ARNIM's inquiring whether the minor States of Germany would be represented diplomatically abroad. They had the right to such representation, if they pleased to claim it; but every one who could really appreciate the interests and situation of the German Empire must know that nothing could be more inconvenient in practice. Small diplomatic meddling was not at all likely to conduce to the maintenance of peace based on the alliance of the three Eastern Empires. Nor would Prince BISMARCK encourage any great sensitiveness on the part of Germans to the discourtesy shown them by the French. A good kind lady like the German EMERLES might fondly hope that all ill-feeling would die away directly peace was concluded, but experienced men could be under no such delusion. Prince BISMARCK had very little pity for German tradesmen and artisans who chose to go to France after the war in order to make money, and then complained that they were not well received. If there was anything of which formal notice could be taken, Prince BISMARCK wished that a very decided line should be adopted, and he was even more decided than Count ARNIM himself in desiring reparation to be made for a discourtesy said to have been shown at the PRESIDENT's table by Madame DE ROTHSCHILD to Count ARNIM. That any such discourtesy was ever shown is not to be for a moment a sinnet. It is best not to believe anything that Germans or Frenchmen say of each other. If ever there was a point as to which all French observers agreed, it was that the German officers habitually beat their private soldiers during the war; but we understand that Germans of the highest respectability, and with ample means of knowing the truth, deny that anything of the sort ever took place except very rarely, and that then the officers were made to apologize before the regiment. Whether Count ARNIM was insulted, or only imagined himself to be so, at any rate Prince BISMARCK was for taking up warmly a case of positive annoyance; but he strongly advised Count ARNIM, if fine ladies and gentlemen merely cut him, to bear it with indifference. Nor would he give any countenance to a suggestion that the policy of France towards Italy should be watched with a jealous eye. Prince BISMARCK had not the slightest objection to Italy and France being on the best terms possible. Unfriendliness between them might lead to a war, and a war between France and Italy would be a misfortune to Germany, as Germany could not afford to see Italy crushed, and so she might have to go to war, however much against her will. It is not often that a statesman can be said to have been right throughout, but as to the questions touched on in the despatches now published, it is not saying too much to say that Prince BISMARCK was right throughout in the main lines of his policy. He got his money, he allowed France to nurse itself into a neutral nondescript sort of Government which is exceedingly inoffensive to neighbouring Powers, and he has kept the peace of Europe unimpaired. So far as can be seen, not one of these objects would have been attained if Count ARNIM had had the direction of German affairs, and if the policy of Count ARNIM had prevailed.

SPAIN.

A WEEK ago Marshal SERRANO at last left Madrid for the North. Since he has thought fit to assume the chief command, it may be plausibly conjectured that there is a prospect of some considerable success. The rumours of secret negotiations with the insurgents have lately subsided; but the arrival of the head of the Government in the Northern provinces will perhaps revive the expectation of a compromise. Two years ago SERRANO, then in the service of King AMADEO, effected a temporary and superficial pacification by granting an amnesty to the insurgents who were at that time unprepared to continue the struggle. He has never undertaken to acknowledge the *fueros* which Don CARLOS is pledged to maintain; and it may perhaps be too late to make the con-

cession, nor is it certain that it would be respected by future Governments. It seems more probable that Marshal SERRANO meditates some definite military enterprise by which the campaign may be creditably closed. He last appeared at the scene of action when, after the failure of MORRONE to penetrate the Carlist lines, it had become urgently necessary to relieve Bilbao. Large forces had been collected for the purpose under the ablest Spanish general, and the enterprise was, as the result showed, neither difficult nor dangerous. The merit of the operations was principally attributed to CONCHA; but the PRESIDENT returned to Madrid with the reputation of good fortune, if not of extraordinary skill and daring. Only a few weeks afterwards the death of CONCHA terminated a campaign which had been unusually vigorous; and since that time the only serious advantage obtained by the National troops has been the relief of Irun. General LOMA encountered a severe check in a recent attempt to advance from San Sebastian; and the conjecture that his movement was intended as a diversion seems to have been erroneous, for neither party appears to have attempted any military operations in Navarre, either before or after LOMA's advance. If the reports of newspaper Correspondents may be trusted, the Carlists and the Republicans are equally satisfied with a condition which seems to be unaccountably exempt from the ordinary consequences of war. The people of Estella have money to spare for gambling at fairs and on feast days, and the Governor of Pampeluna, though the town has for several months been blockaded, boasts that he has provisions to support both the garrison and the inhabitants for two or three years. His state is the more satisfactory because the most competent judges are of opinion that the possession of Pampeluna would be a useless encumbrance to the Carlists, who have no troops to spare for garrisons.

Among many paradoxical inferences which are drawn from the anomalous position of Spain, the oddest is the proposition that there would be no advantage in putting an end to the Civil War. As the sporting enthusiast in the story proved that a fox-hunt was equally pleasant to all parties concerned, one observer at least of Spanish affairs professes to have satisfied himself that the Carlist war prevents or postpones more evil than it causes. The Southern provinces carry on a prosperous commerce without the smallest concern for the events of Biscay and Navarre. It is only necessary to their welfare that there should be some kind of Government at Madrid which is generally recognized, and the acquiescence of the country in the dictatorship of SERRANO might probably be disturbed if he were not entrusted with the conduct of a war which involves the maintenance of a considerable army. If Estella, after having been for several months the Carlist headquarters, teems with plenty, and if Pampeluna is content to be blockaded, it seems unnecessary to waste compassion on a nation incapable of suffering from war or from anarchy. The theory that the insurrection has up to this time been beneficial probably represents the real feeling of SERRANO and his Ministry. The Republicans who a year and a half ago enjoyed undisputed power have for the present disappeared, and no party thinks it worth while to demand the convocation of a Cortes. The ancient rivals and enemies of SAGASTA have consequently no means of driving him from office, although his tenure may be insecure, if it is true that differences have arisen between the PRESIDENT and his principal Minister. The finances are in their normal condition of insolvency, but it would seem that capitalists can always be found to advance money when it is absolutely wanted for the army; and the agent of the English bondholders at Madrid has lately concluded an arrangement which is supposed to secure something for his unfortunate clients. It would have been surprising if SERRANO had risked the advantages of his present condition by assuming the command of the army unless he has good reason to think that he can raise his military reputation. It is said that the numbers of his army in the Northern provinces now amount to a hundred thousand men, of whom one half are available for operations in Navarre, while the Carlists, though their best regiments are superior to the Republican troops in quality, dispose of a far smaller force. LASERNA and MORRONE, who have not lately been heard of, may perhaps have been kept inactive by orders from Madrid for the purpose of reserving to SERRANO the opportunity of some brilliant success. It appears that on the whole the Carlists have become weaker

during the autumn; and the inequality of the two armies has increased.

It is said that the respectable classes throughout Spain are nearly unanimous in desiring the restoration of the constitutional monarchy under the Prince of ASTURIAS. Melancholy experience has shown that the dethronement of Queen ISABELLA was a ruinous blunder, although the error might possibly have been repaired but for the assassination of PRINCE ALFONSO. Almost any established Government, especially of the hereditary form, is better than almost any substitute which can be artificially provided. The name of the QUEEN might have been advantageously used by the opponents of her misgovernment, even if they had found it necessary to appoint a Regency or some other power to supersede her practical authority. The worst days of NARVAEZ or O'DONNELL were preferable to the uncertainty and the changes of the last half-dozen years. During the reign of Queen ISABELLA there were always Cortes, although the elections might be corrupt, and although successive Ministers might care little for Parliamentary control. For twenty years there was an intermission of civil war, and the prosperity of the country rapidly increased. Above all, Republicanism was latent, or almost non-existent; and recent experience has removed any doubt which might have been entertained as to the tendency of the doctrines of CASTELLAR and a few other political dreamers. Whatever may be the case with Franco, there are in Spain no moderate Republicans, nor is there any class which believes that a Republic can be other than Socialist, Jacobin, or Federalist. Nothing is known of the character or promise of Don ALFONSO; but it is understood that, if he were to become King, he must rest on the support of the upper and middle classes, who might perhaps secure the aid of the army. His adherents have a still better reason than the members of other parties for regarding with complacency the continuance of the Civil War. Their candidate is at present too young to reign in person; and it would be difficult to find a Minister who could be trusted to act in his name. It would not be desirable that a young King should share the unpopularity which has been incurred by SERRANO or SAGASTA. A Restoration is most likely to be permanent when it follows a period of discontent and distrust for which the returning dynasty is not responsible.

The relations between the Spanish and French Governments have improved since the hope of German intervention proved to be chimerical. Marshal MACMAHON and his Foreign Minister have shown much judgment and good temper in not founding a quarrel on the querulous Note which enumerated a long series of pretended breaches of French neutrality. The Duke DECAZES wisely allowed some time to elapse before he returned an answer; and now, if the tenor of his Note is accurately reported, he has confined himself to conventional phrases, and to moderate protests against the excessive pretensions of the Spanish Government. It was out of the question that a foreign Power should be allowed to criticize the selection of French agents, or to prescribe the method in which precautions should be taken against acts inconsistent with neutrality. The French Government has not allowed Spanish troops to assemble within its own frontiers, and it has discouraged the trade in military stores, which cannot be wholly prevented. If it had inclined more definitely to the cause of the Carlists, the Government of Madrid must have, however unwillingly, acquiesced in a partiality which could not have been effectually resented. The Carlists occupy a considerable part of the provinces nearest to France, and there is probably political sympathy as well as commercial and social intercourse between the inhabitants on either side of the border. Some gratitude is due to France for joining in the recognition of Marshal SERRANO's Government when it was proposed by the German Government; and it may be remembered that the French and English Ministers extended to the form of government the recognition which was restricted by Germany to the person of Marshal SERRANO. Whatever may be the wishes of the Spaniards, the French people, in common with the rest of Europe, would willingly see the conclusion of peace. It would be a matter of indifference whether the victory rested with one side or the other, if the complete success of Don CARLOS were not impossible.

ST. IVES.

IT is not often that the modest borough of St. Ives gets itself talked of. But greatness is thrust upon most people or boroughs if they can but wait long enough; and St. Ives has sprung into a momentary notoriety, by the death of Mr. DAVENPORT having caused a vacancy in its representation. The recent Parliamentary history and present Parliamentary feelings or prejudices of St. Ives have been sketched by a vigorous and faithful hand in the *Times*, and the picture presented admirably illustrates the position of parties, the difficulties of candidates, and the wishes of electors in an unobtrusive little English borough. Imperial politics are totally and even ostentatiously disregarded; and every elector is absorbed in the humble but practical thought which of two respectable gentlemen he shall oblige, what benefits will accrue to himself and his neighbours, and for which of the crochets which he thinks he understands he can best secure attention. In the last Parliament St. Ives was represented by a Liberal, but for eighteen months previously to the last election the borough had been carefully nursed by an enterprising Conservative, who, having hired a big house in the neighbourhood, set himself to be pleasant, liberal, and gentlemanly to every one. Nursing proved efficacious, and when the dissolution came, the late Liberal member did not think it worth while to contest the seat. A Liberal candidate was, however, obtained at the eleventh hour, but a majority of 391 rewarded the Conservative for the pains he had taken to make himself popular. This time the contest promises to be a closer one. The claims of the Conservative candidate are, that he is the uncle of an infant owner of property in the borough, that he has interested himself in making a road, and has done much to bring a railway to St. Ives, and to improve its quays. These are incontestable merits, and Mr. PRAED stands on them. Sir FRANCIS LYCETT is the Liberal candidate; and his claims are of a very different kind. He addresses the soul just as Mr. PRAED appeals to the body. He has not been in a position to nurse the borough, to which he is a perfect stranger, but he is just the man, he may reasonably think, for a borough which is said to be remarkable beyond, perhaps, any other borough for Dissent and Teetotalism. He is, it appears, well known for his large donations to Wesleyan chapels, and he is one of those few faithful ones whom Sir WILFRID LAWSON must fondly cherish, for he has not only voted for the Permissive Bill, which we know means nothing, but he states that he really believes in it. He is also pledged to remove from the Statute-book that "foul stain" which has lately engrossed the vacation energies of Mr. STANSFELD. Neither candidate bothers himself much about questions of general politics, which at St. Ives are admitted to be irrelevant. The two candidates come forward each with very different things to offer; but each with things which at St. Ives are thought in their several ways incontestably precious. The Conservative offers roads, railways, quays. The Liberal offers chapels, no beer, and the free spread of disease. It must be very puzzling to many an honest simple-hearted elector to decide between these contending claims. When he gets on to a bit of good road he must feel a staunch Conservative; when he passes a chapel, and thinks that a rich member would put up gratis many more of those attractive structures, he may easily pass for the moment into an unconscious supporter of Mr. GLADSTONE. No wonder that the contest threatens to be a severe one, and that the most experienced local judges cannot guess which way the election will go.

It might have been thought that this great battle between roads and chapels might be fairly fought out without the intervention of outsiders, and that Mr. PRAED and Sir FRANCIS LYCETT would have sufficed to submit fairly to the constituency the plain issue which of them was to be sent to aid in governing an Empire on which it has been observed the sun never sets. But this is not so. St. Ives is not to be let alone in this way. We are informed that Miss BEEDY, a delegate from the Manchester Branch of the Woman's Suffrage Association, has arrived in the borough, and that it is the general opinion that she will further complicate matters. Standing for a borough has long been known to be a rather painful process, but there is now added a new terror to candidatureship. The irrepressible female scents the battle from afar. She is an oppressed British subject, but she still is allowed to take a railway ticket from Lancashire to Corn-

wall. When she is at St. Ives she is perfectly at liberty to repair to one of those severe and simple places of entertainment which Sir WILFRID LAWSON thinks will gradually draw travellers from the traitorous comforts of an inn. When she leaves her coffee-house she is free to speak with the unhesitating confidence of her sex, and to prove conclusively how much better and happier the world would be if all the women at St. Ives were like her. She may probably find that for once luck has befriended her. She may be welcomed by a candidate. Merely as a guess we should imagine that Sir FRANCIS LYCETT is the sort of man to like Miss BEEBY. At any rate, if Sir FRANCIS LYCETT does not like her, who would? She does but add one more crotchet to his repertory. But it must be owned that to many liberal candidates Miss BEEBY would terribly complicate matters. They could do neither with her nor without her. In fact, from whatever point of view we regard the St. Ives election, it is pressed upon us how much nicer it is to be a Conservative than a Liberal candidate. If a wealthy and enterprising man wishes to get into Parliament on exclusively private grounds, and without reference to confusing considerations of general politics, he has very much to gain by choosing to be a Conservative. He often, of course, has to work hard. Nursing a borough is a matter of considerable outlay, exertion, and self-sacrifice. The late member for St. Ives nursed very hard. He was all things to all men. He was far too wise to leave Dissenters out in the cold. Not only did he open his purse to their gentle solicitations, but he actually attended the ministrations of their pastors. This is something like nursing. But then even here a Conservative has an advantage. He does not commit himself. He is only performing an act of graceful condescension. He does not pretend to agree with Dissenters; he merely loves them. The unfortunate Liberal, on the other hand, has to take just as much trouble, and also to state that in his opinion the political and religious view of Dissenters are eminently wise, just, and profound. He really has to cut himself off for a time from his liquor, or at most ventures to take a little moderate stimulant, and that purely for the sake of his health. Miss BEEBY will not let him off. He must be either for her or against her, and she would scarcely come all the way from Manchester unless she was the sort of woman to make men who oppose her uncomfortable. The present Conservative candidate has taken a bolder line than his predecessor. It is not by nursing that he hopes to win. He will have nothing to do with Dissent, he abhors the Permissive Bill, and thinks the Statute Book better with the foul stain on it than without it. O fortunate agricultural personage, if he did but know his goods! How many ardent and philosophical Liberals must long to be in his shoes! Strong in his roads, his railways, and his quays, he can positively say what he means, pass unheeding by cluypels, and laugh at Miss BEEBY.

Few of those who live at a distance from St. Ives will care very much which way the election goes. Even a Whig Whip could scarcely see in the return of Sir FRANCIS LYCETT the sign of a Liberal reaction. It is only on account of the poverty of political nomenclature that Sir FRANCIS LYCETT is called a Liberal. He is a chapel-donation man; he is a no-beer man; he is a foul-stain man; but what have these things to do with Liberalism, if by Liberalism is meant the application of enlightenment to Imperial politics? It is true that at some distant period, and in a contingency which no one can now foresee, he might silently swell by one vote a majority that would upset Mr. DISRAELI, and install in office a new Ministry that would uphold the 25th Clause, make up its quarrel with the publicans, and reclaim Mr. STANSFELD to voting for the Statute Book as it is. In that sense Sir FRANCIS LYCETT is a Liberal; but in himself he is as illiberal as any one well could be. Of the two Mr. PRAED may perhaps the more properly be called a Liberal. It is not of course in the highest style of Liberal art to stand boldly and nakedly on the merits of roads, railways, and quays; but it is Liberal to protest against the intolerance of Dissent, the interference of teetotalers, and the existence of Miss BEEBY. If Mr. PRAED is returned, he will not have to wait for years before he can do something. He can begin at once to support an existing Ministry which certainly is not illiberal. The Conservatives have the enormous advantage of offering to a nation which it may be hoped is not without sense an actual amount of moderate enlightenment, and a perfect freedom from crotchets. The Liberal party can but

offer a possible amount of greater enlightenment coupled with the chance of slavery to crotchets. If Sir FRANCIS LYCETT and Miss BEEBY win the seat, their triumph will be the triumph of the very smallest prejudices of the very smallest kind of people. It is but a hazy kind of consolation that in an odd indirect way they might possibly be also helping some day to give office to Mr. GLADSTONE, whom they probably think much inferior to Mr. SPURGEON, and to secure an opening for the adoption of a really Liberal policy which would be equally beyond their comprehension and alien to their tastes. Moderate Liberals might shrink from actively supporting the donor of roads and railways, but what is there in Sir FRANCIS LYCETT to attract them? The lowest depths of the humiliation of the Liberal party cannot be measured merely by looking at the results of the last general election, and by watching the erratic leadership of Mr. GLADSTONE. St. Ives was needed to complete our experience, and it was reserved for Sir FRANCIS LYCETT to show how very trivial and unreal are the things which a Liberal candidate in the present day can bring himself to offer, and which Liberal electors can be supposed to accept.

THE COAL DUTY.

THE deputation from Staines and other suburban parts of the Metropolitan district which lately waited on the CHANCELLOR of the EXCHEQUER had plausible grounds for their protest against the application of the Coal duties to the removal of bridge tolls. It was perhaps not their business to consider that they were raising a question which is involved in the levy and expenditure of almost all local and general taxes. There is no obvious reason why consumers of spirits, tobacco, and malt should maintain the army and navy by contributing more than a third of the whole revenue of the country. The money is taken from them because they have the means of paying it, and it is spent in the manner which is deemed by the Government and Parliament most conducive to public welfare. The coal duty of thirteence per ton is levied over the whole area of the Metropolitan Police district, and it is obviously impossible that its proceeds can in any particular case be employed with equal advantage to every part of the metropolis. Fourpence of the whole duty has been assigned to the Corporation of London, and the remainder to the Metropolitan Board of Works. Both of these bodies have mortgaged their respective shares for many years to come, so that neither the receipt nor the expenditure can during the interval admit of interference. The Board of Works, desiring to raise a sum of about half a million to buy up the tolls on some of the bridges, proposed to the CHANCELLOR of the EXCHEQUER that Parliament should be asked to extend the term for which the Coal duties had been granted. On the security of the deferred income they would borrow the necessary amount, so as to give immediate relief to the traffic at the cost of the taxpayers of the next generation. In anticipation of the objection which has been raised by some of the outlying districts, the Board of Works remarked that the suburban roads were maintained with the aid of the metropolitan rates. The Staines deputation replied that proximity to London was in many ways costly, and that their contribution to prisons and constabulary expenses was increased by the prevalence of crime in the more densely inhabited parts of the metropolis. Sir STAFFORD NORTHCOTE, probably not wishing to discuss the principal subject, intimated that the comparative burdens imposed on different parts of the district ought to be clearly ascertained before a decision could be formed. On further consideration he will probably find that neither the arguments of the deputation nor his own partial answer touch the material issue which he must decide. If the Coal duties are a legitimate source of revenue, the only remaining question is whether the purchase of the tolls would produce greater public advantage than any other mode of outlay.

Civic improvements are necessarily local, and the immediate benefit accrues to those who are nearest the spot. Not only the south-western suburbs and rural portions of the metropolitan area, but the greater part of London itself has no direct interest in relieving the bridges from tolls. The people of Staines, when they visit London, arrive at the Waterloo terminus, and those of them who proceed westward and northward pay the toll on Waterloo Bridge. No Londoner east of Temple

Bar or south of Hyde Park has, as a general rule, to cross a toll bridge. The persons who would profit most largely by the abolition of the tolls would be house-owners on the south bank of the river, who would immediately raise their rents in proportion. If taxation were always imposed in consideration of an advantage directly received, tolls on bridges and roads would be the most equitable of all possible burdens. The only persons who are at present taxed at the toll-gates are those who use the bridges for themselves and their goods. The only other class which is interested in the matter consists of those who would pass over the bridges if they were not deterred by the toll. Not only tolls, but taxes on consumption, are principally injurious through the restrictions which they involve on convenience and enjoyment. Every person who takes a circuit to avoid a toll-gate suffers superfluous toil without contributing to the objects for which the toll is levied. The Corporation some years ago opened Southwark Bridge, not for the relief of the pockets of those who paid the toll, but that the bridge might become a crowded thoroughfare instead of being comparatively useless. Whenever a toll-gate is removed from a bridge or road, the tax or rate which takes its place is paid in part by those who have no interest in the maintenance of the structure.

The promoters of the opposition to the scheme of the Metropolitan Board were brickmakers and manufacturers, who, as large consumers of coal, objected to the continuance of the duty beyond the term already fixed by law. It is evident that the duty must put them at a disadvantage proportioned to its amount in competition with similar industry prosecuted outside the metropolitan area. The question whether they were directly interested in the abolition of the bridge tolls was of secondary importance. The riverside traders in the east of London have quite as little need to use the bridges, and they also are subject to competition, and are interested in the cheapness of coal. If the duty is as convenient and just as any other mode of raising a municipal revenue, there is no sufficient reason for objecting to the proposal of the Board of Works. It might well become the duty of a Corporation or similar body to construct a bridge out of the civic funds, if there were no other means of providing for traffic. It would be highly inconvenient that there should be no carriage road across the river between Westminster and Blackfriars. Sixty years ago private adventurers undertook to supply the want, and the tolls which they were authorized to levy have provided them and their successors with but a scanty remuneration on the original outlay. If the bridge had been built out of public or civic funds, and opened freely to traffic, a tax of some kind must have been levied for construction and maintenance, which would have been for the most part paid by those who never cross the bridge. It is almost impossible to find any item of national or municipal expenditure which is equally beneficial to the whole community. The erection of a bridge over a great river which cuts a metropolis into two parts is as much a public concern of the inhabitants of the City as any kind of outlay which can be suggested; and if a bridge ought to be built at the common expense, it ought also to be redeemed in the same manner from a toll which renders it less useful.

The Coal dues are exposed to an adverse presumption, as the policy of English legislation is inconsistent with local or municipal taxes on commodities. There is probably no other instance of a payment resembling an *octroi* in any part of the United Kingdom since the dues on shipping and merchandize were transferred from the Liverpool Corporation to the Mersey Board. All local charges are met by rates, except when a Corporation has property of its own, or when roads and bridges are maintained by tolls. It is true that the objections to an *octroi* which are founded on the personal annoyance and inconvenience which it causes have no application to a bulky article separately imported in enormous quantities. The Coal duties are levied cheaply and without impediment to trade; and the only evil which they cause is an increase in the price of coal, of which the dealers of course impose a certain percentage. To the householder it perhaps matters little whether he pays another penny in the pound of rates or eighteenpence a ton on the cost of his coals. Manufacturers and other large consumers find that the duty adds perceptibly to their working expenses, while the prices which they can charge to their customers are regulated by the competition of untaxed rivals. If the freight of coal

for railway from the pits to London is six shillings, the addition of another shilling and a penny involves a serious addition. As the duties must in any case continue for several years, it would be highly inexpedient to perpetuate them or to prolong the duration by prospective legislation. When the subject was lately discussed in the Common Council, there seemed to be a general impression that it would be well to let the matter rest for the present. A future Parliament will consider with fuller knowledge the expediency of maintaining in the case of the metropolis an anomalous, or at least an exceptional, kind of taxation. If no other means of freeing the bridges can be discovered, Waterloo and Vauxhall must remain comparatively useless. It is barely possible that within fifteen years it might occur to some benevolent millionaire that the purchase of the tolls would combine useful liberality with pardonable ostentation.

PUBLIC EXPENDITURE IN FRANCE.

THE *Correspondant* for the 10th of December contains a paper of great interest on the Public Expenditure in France. M. LEGUYR compares, with an absence of national vanity rare among his countrymen, the action of the French and the Prussians under not very dissimilar circumstances. After the defeat of Jena, the KING reduced his Civil List; the officials of all grades accepted lower salaries; unnecessary places were abolished; labour was set free from a variety of annoying restrictions; loans were granted to ruined landowners; the acquisition of landed property was made easier; all religions were declared equal before the law—in short, nothing was left undone which could unite the nation in the effort to recover its position in Europe, or which was likely to make that effort successful. When France found herself confronted by the same problem in 1871, the Assembly ought at least—so M. LEGUYR argues—to have refrained from crippling industry by injudicious taxes, and from ignoring the plain teaching of ten years of free-trade and consequent commercial prosperity. It might, it is true, have been found necessary to burden the country by taxes on locomotion or by heavy customs duties, as the only means of getting the indemnity paid; but at all events the Assembly ought to have considered whether the balance between the public income and the public expenditure might not be restored by a reduction of the latter as well as by an increase of the former. The ground of M. LEGUYR's complaint is that the Assembly has done nothing of the kind. The cost of administration remains what it was under the Empire. France pays a great deal for its government, and gets a very inadequate return for the money laid out.

In a country in which revolutions are so frequent the character and composition of the permanent staff of the several services is, as M. LEGUYR points out, of more than ordinary moment. It is the one element in the Government which has been handed on from the Absolute Monarchy to the Constitutional, from the Constitutional Monarchy to the Republic, from the Republic to the Empire, and from the Empire back again to the Republic. Yet, except in two offices, there is no preliminary test of qualification for admission to this all-important body. The Minister puts in whom he likes, and in some instances places have almost become hereditary. Promotion is equally regulated by the personal choice of the Minister or of his patronage secretary. Sometimes these authorities are guided by seniority; more often they act on no ascertained principle. An appointment in the French Civil Service confers no vested interest. Given in the first instance as a matter of favour, it may be taken away by an act of caprice. M. LEGUYR compares this system with the Prussian, very much to the disadvantage of his own nation. In Prussia there is a severe examination before a young man can enter the Civil Service, and his fitness for promotion in it is also tested by examination, coupled with and qualified by the notes of the candidate's superior officer as to the manner in which he has acquitted himself in his subordinate rank. A post under Government can only be lost by a man's own fault, and if he shows any special talents, he is attached for a certain time to all the branches of the office in succession, after which he is regarded as belonging to a sort of administrative staff, from which vacancies lying outside the usual course of official promotion are usually filled up. It is to the care

taken in the selection of the members of the Civil Service, and to the opportunities of getting on in it afforded by these regulations, that M. LÉGOYT attributes the very strong regard for the good of the service which characterizes Prussian officials. It is not only in the quality of the material employed, and consequently of the work done, that the French public offices are inferior to the Prussian. The clerks give much less of their time to the State. The official day is supposed to extend from ten to five, but M. LÉGOYT says that in this there are seldom included more than four hours of real work. In Prussia the clerks work from eight to twelve, and from two to six, and as they sit in large rooms, under the eye of a superior official, there is not much chance of their being able to take life too easily. In France there is an entire absence of supervision. There is no machinery for ascertaining when the clerks come in the morning, or go in the evening, or how they are employed in the interval. In no country in Europe, according to M. LÉGOYT, is public business got through with so many delays as in France, and to this cause is mainly attributable the feeling in favour of decentralization which has lately grown up in the provinces. Under so careless a system as this it is necessary to have a great number of spare workmen. Without such a precaution the business of administration might come to a stand at any moment. It is not surprising, therefore, that the number of clerks in each department should be greatly in excess of what would be required if each man did his fair share of work. There appears to be no check upon this increase answering to that supplied in this country by the necessity of stating in the Estimates the precise sum required for the aggregate salaries of each department. The amount of fresh admissions depends partly on the desire of the Minister to please his personal or political friends, and partly on the necessity under which the heads of the departments labour of making numbers take the place of zeal.

M. LÉGOYT proposes that a maximum number of clerks in each office should be assigned, and any excess above this number gradually reduced; that the number of offices should be lessened by grouping two or more under a common head; that a test examination should be instituted both for admission and for promotion, subject in the latter case to the report of the official under whom the candidate has been employed; that the maximum and minimum salaries in each class of the public service should be prescribed; that the age of superannuation should be raised; that the allowance for personal expenses in the case of the higher officials should be reduced; and that there should be fixed hours of daily attendance, and means of discovering whether the clerks abide by these hours. In addition to these general suggestions, M. LÉGOYT mentions certain reforms which are required in particular branches of the public service. Judges should be made to sit for more hours in the day and for more days in the week, and the list of matters which may be disposed of by a single judge should be greatly increased. This would necessitate a rise in the standard for admission to the rank of the magistracy. As regards Foreign Affairs, M. LÉGOYT wishes to see the qualifications of the Consular Body raised and the number of Consulships lessened. He suggests a similar reduction in the number of Prefectships, to be effected by making them represent the central Government in groups of departments, instead of, as now, in single departments. The French settlement in Cochin China should be given up. The subsidies now paid to secondary education should be withdrawn, and several other grants made to objects which ought to be self-supporting should share the same fate. Even useful public works must be postponed to a more convenient season. The money saved by these means would, if M. LÉGOYT had his will, be largely employed in improving the army. Until this has been effected, France has no right, he thinks, to feel her independence secured against the huge armaments and the violent passions of her German neighbours.

Putting aside the particular purpose for which M. LÉGOYT desires to see these changes introduced, there can be no question that he has made out a good case for very many of them. The French public service would apparently have supplied Mr. DICKENS with a better model for his Circumlocution Office than the worst managed office in England. But though reform is undoubtedly wanted, it is extremely unlikely that it will be effected on anything like an adequate scale. The history of Mr. GLADSTONE'S Administra-

tion may serve to show M. LÉGOYT what a hornet's nest is sure to come about the ears of a Minister who tries to reduce the number of clerks employed under Government. Each such saving is in itself too trifling to call forth any enthusiasm in the majority which is benefited by the change, while it is sure to excite bitter hostility in the minority which suffers from it. In France the number of persons who look forward to being employed under Government is much greater than in England, and the habit of regarding the Civil Service as a career of genteel indolence is more confirmed. Again the unpopularity which follows from reforms of this kind in England only affects a particular Ministry, but the same unpopularity in France might discredit the political institutions under which it was attempted to introduce them. Consequently the risk and the responsibility of failure are much greater, and even a Ministry which has no interest in maintaining abuses might hesitate before undertaking to root them out. If the public expenditure is to be reduced, it had best be done by the existing Assembly, for the simple but sufficient reason that it cannot well become less popular than it is already. As it has nothing to lose by this act of patriotism, there will be the less excuse if it leaves it unperformed.

COMMONS AND INCLOSURES.

THE triumph which was lately celebrated by the inhabitants of East London under the presidency of Sir WILLIAM HARCOURT was natural and legitimate. The Corporation of London having accidentally acquired a right of common in Epping Forest, has, after a legal contest, defeated the lords of manors who claimed large rights of inclosure. The victory which has been won by the owners of a burial-ground will, unless the judgment of the MASTER of the Rolls is reversed on appeal, ensure to the benefit of a large living population. The Crown might with a trifling sacrifice have kept the Forest open by refusing to sell certain old feudal rights which were incompatible with inclosures; but official purists objected to the application of the minutest fragment of national property to the benefit of a local population, however large. The question was the same which was raised in the disputes about the Thames Embankment; and public functionaries who guard the funds entrusted to them with even excessive vigilance ought not perhaps to be severely blamed. The reasonable desire of preserving large open spaces in the neighbourhood of London has a recent origin. Parks and pleasure-grounds are for great cities, as for private persons, expensive luxuries; and Sir W. HARCOURT and his audience naturally congratulated themselves on the acquisition of a property of great value which had cost them nothing. The Corporation deserves the popularity which it has acquired by conducting the litigation, as far as it has gone, to a successful conclusion. No orator could be better qualified than Sir W. HARCOURT to expatiate on the advantages of uninclosed commons and forests. His contrast between eating turtle soup and skinning flints was in the best style of popular rhetoric. It was not necessary to remember that Common Councilmen dine for their own pleasure, while Mr. LOWE and Mr. ARNOLD undertook the disagreeable task of skinning flints for the purpose of increasing the public revenue. Sir W. HARCOURT is one of a band of members who have supported Mr. FAWCETT for several years in a successful resistance to all Inclosure Bills; and his recent speech seemed to involve a pledge that the same policy would be pursued on all future occasions. There was no question of an Inclosure Bill in Epping Forest. The rights of all parties have, subject to a possible appeal, been determined by the proper tribunal, and the lords of manors, however much they may be disappointed, have no right to complain. Citizens of London, or tourists who have occasion to visit Epping Forest, are not likely to sympathize with the grievance of alleged owners who would have closed up all access to the open spaces. If the sole object of legislation were to increase the collective wealth of the community, no common would be allowed to exist. Divided into villas and pleasure-grounds, Epping Forest would have an enormous money value, whereas the land henceforth will be almost unprofitable; but unproductive expenditure may often be advantageously incurred, and in this particular case private persons only were the losers.

If the decision of the Court had been adverse to the Corporation, the public inconvenience which might have

been caused by the maintenance and extension of inclosures would have furnished no reason for interference with the rights of property. If London has a legal right to any land, or easement in land, its property ought to be carefully preserved; but when its population requires additional outlets the full value of any land which may be required ought to be paid. In general the whole estate in common land is exhausted by the claims of the lord and the commoners, and in certain cases of the copyholders of the manor. If there were any doubt as to the law, much might be said as to the hardship of allowing no compensation to those who may have been accustomed to unlimited rights of way in every direction; but the license of wandering at will and the enjoyment of fresh air and fine scenery were not recognized as valuable commodities when the law and the practice of Parliament were constructed. Where inclosures have been sanctioned a few roads have been invariably substituted for the free passage over open spaces; and until lately the promoters of inclosures had been regarded as public benefactors who undoubtedly made more than two blades of grass grow where one grew before. The change in public opinion on the subject is not unreasonable; but the owners of manorial and common rights ought not to be the victims of sanitary and æsthetic improvement. It is perfectly fair that they should be subject to compulsory purchase of their rights; but they ought not to be compelled to give their property away. The commons at Wimbledon and Putney have lately been purchased by the neighbouring residents for the express purpose of preserving them from inclosure; and the long dispute as to the right of inclosing Hampstead Heath has been settled by a similar compromise. If the Corporation and the other commoners had agreed with the lords of manors to divide Epping Forest among themselves, it would have been difficult for strangers to intervene. At the late meeting Mr. SHAW LEFEBVRE made an attack on a lord of the manor who asserts the right of making an inclosure at Hackney. If the claim is unfounded, the lord will inclose at his peril and to his certain loss; if, on the other hand, he can establish his right, there is no reason why he should be heavily mulcted for the benefit of the neighbourhood. It is extremely undesirable that legal rights should be in any way affected by speeches at public meetings and by letters in newspapers. Mr. SHAW LEFEBVRE may wish that the Metropolitan Board of Works should defeat a private landowner in a pending litigation, but his preference is irrelevant, and his arguments are addressed to the wrong tribunal.

The indiscriminate rejection of all Inclosure Bills is a capricious and unjust substitute for the unduly lax practice which previously prevailed. In former times Inclosure Bills were considered by Parliamentary Committees on their merits; and they were sometimes rejected on reasonable grounds of opposition. About thirty years ago the jurisdiction was practically transferred to the Inclosure Commissioners, whose awards were as a matter of course confirmed by Parliament in an annual Bill passed at the close of every Session. The result of the appointment of the Commission was the disuse of the legislative discretion which had been previously exercised by Parliament. The Commissioners understood, perhaps rightly, that their function was only ministerial, and they consequently passed all inclosures on compliance with certain conditions. It was necessary that the lord of the manor and a certain proportion of the commoners should assent, but strangers to the property, although they might be near neighbours, had no voice in the discussion. The interpretation of their powers by the Commissioners was justified by the uniform adoption by Parliament of their recommendations. There was in truth much ground for the assumption that the conversion of common into sovereignty was in the majority of cases beneficial. In hill countries, and wherever extensive wastes abounded, all improvement was impossible until the land was apportioned among private owners, and the exercise of undoubted rights of sheep-walk often depended on the power of the commoner to assert his right. The owners of large flocks still in some places employ fighting shepherds and fierce dogs to exclude from large pastures of common land less powerful competitors. An inclosure in Wales or in the North produces within a few years visible signs of increased prosperity, and often doubles the value of the land. Mr. FAWCETT and his supporters, by systematically rejecting the annual Inclosure Bill, impose a heavy and useless tax on the owners of manorial rights and on the

commoners. The change from waste hill-sides into productive fields affords even the idler and the traveller some compensation for the restriction of his former liberty.

The purchase of open spaces for the use of urban populations is happily becoming common and popular. There is no better proof of the improvement of popular taste than the growing conviction that a common is in many respects preferable to a park. Gorse and fern, Hawthorns and thickets of brambles, interspersed with green glades, offer to the citizen a more complete and refreshing variety than the trimmest specimen of landscape gardening. It is proper that comparatively small pleasure grounds, such as the London Parks, should be highly ornamented, but at Wimbledon or at Epping the preservation of the natural scenery is the most important object which Managing Committees can pursue. That the resorts of townsmen should in some sense be vulgarized is an unavoidable and enduring misfortune. The mountains in the Lake country and in the region of Snowdon would be more attractive to fastidious visitors if they were not thronged by crowds from the manufacturing towns; but the pleasure of the multitude matters more than the exclusive enjoyment of those who have various resources. It may be hoped that Epping Forest will for many generations be the resort of Londoners.

MURDERERS AND PHILANTHROPISTS.

THERE is perhaps nothing more wonderful in modern days than the curious tendency of a certain school of philanthropy and sentimentalism to make itself a sort of nursing-mother to murder and every form of cruel violence and brutality. It is not improbable that the horrible disclosures which have just taken place at certain trials during the present week in Lancashire will have the effect of making people understand the real character of the everyday ruffianism which has reached a horrible climax in the murder of MORGAN, and the way in which this ruffianism has been deliberately and systematically fostered by the pusillanimous timidity and tenderness of magistrates and other persons; and this may be expected to operate as a wholesome counter-agent to that silly and mischievous travesty of humanity which keeps all its pumped-up tears for the roughs, and has none for their miserable victims. Yet it would have been better if the conviction, sound as it is in itself, that violent crime must be forcibly repressed by adequate severity, had been established in a calmer and more logical way. What is above all wanted in the treatment of criminals is a cool, steady, uniform rigour, which shall be the same at all seasons, and shall know no tides of passion or sentiment, and no respect of persons. It is useless that a few persons in a time of momentary panic or excitement should be severely handled; a regular, unvarying system must be steadily pursued. What is wanted is that criminal discipline should be like a knife worked by machinery—certain to chop off any fingers that come within its range. It is the fluctuation of severity and leniency, and the consequent chances of escape which encourage crime.

It can hardly be supposed that the protest which CRANWELL, the bootmaker who murdered his paramour at Lisson Grove, made in Court against the sentence of death which has been passed upon him will have the result which he desires; yet it must be admitted that, from the prisoner's own point of view, there is much force in his argument. He urged that it would be very unjust to hang him for murder when so many other murderers have, on various pretexts, been allowed to live. He cited the cases of Mrs. VYSE, and of the Rev. Mr. WATSON, and he might have cited the cases of TOWNLEY and others. It is possible that Mrs. VYSE was really insane at the time when she killed her children; but it was never even suggested that there was any reason why Mr. WATSON should not be hanged, except that he was such a very respectable person, and that it would be a disgrace to his cloth. TOWNLEY was a passionate, ill-regulated youth, with a theory of the rights of sweethearts; but no evidence worthy of the name was adduced to prove that he was, or ever had been, mad, and in prison he was afterwards sensible and collected up to the time of his suicide. An effort was made to show that CRANWELL was also mad. Since he has been in gaol he has, according to the testimony of the surgeon, "always talked" and acted like a rational man, and no proof of previous insanity was even attempted. It was also admitted that he was perfectly aware that he was being tried for murder,

and his subsequent speech confirmed the impression of his perfect sanity. Yet, on the strength of certain alleged symptoms of "a highly nervous temperament," which are common to a vast number of persons, and which any one could easily assume, a doctor who had seen him only for a few minutes, and whose visit apparently he expected, seriously suggested to the Court that he should be regarded as mad. It is, unfortunately, too true that this plea, supported by similar professional evidence, has in too many cases in recent years been the means of baffling the law, but it is to be hoped that another case will not be added to the list. It is not impossible that CRANWELL himself has been deluded by the apparent immunity for murderers which successive Home Secretaries seemed to be bringing into fashion. If TOWNLEY and Mr. WATSON escaped, he may have argued, why should not I? These are not days when people are hanged for murder if they take care to get up their case properly. The only consolation that can be offered to CRANWELL is that, whatever errors in the way of leniency have hitherto been committed, it will in future be recognized as due to him and others in a similar position that murder shall be uniformly punished by death.

It deserves to be noted that the morbid tenderness for murderers which is observable among ourselves is still more flagrantly and conspicuously exhibited elsewhere. There is a story of an Irishman who, in the days of the Temporal Power, defending the Papal Government from the charge of tyranny, remarked that, as far as he could see, there was more freedom in Rome than anywhere else, because you could knock over a man in the street whenever you liked and nobody would interfere with you. There is reason to fear that this is very much the condition of a large part of Italy at the present moment. The Camorristi are still a terror to Naples, and the Mafiosi range at will through Sicily. Brigandage spreads unchecked, and mutilations and murders are of constant occurrence. It was hoped that a national Government, strong in patriotic enthusiasm and popular support, would be enabled to repress these disorders with a firm and unsparing hand; but it would appear that the cowardice or perversity of public opinion operates as a check upon the energy of the Executive. The condition, however, of some parts of the country has become so intolerable that, for once in a way, the local authorities have been forced into energetic measures. The other day ALBERTO RIGGIO, one of the band of LOMBARDO, was beheaded at Palermo. This unusual proceeding has produced a very painful impression in Italy among certain persons who call themselves the friends of freedom and humanity. Is this the result, they ask, of our boasted civilization and political liberty? There is a newspaper called the *Precursore*, which appears to be the organ of the people who think that murderers should be gently argued with and not decapitated, and of course it is eloquently indignant about this outrage on the moral law. We are treated to a sensational description of the scene in a style which is not unfamiliar to us in some of our own newspapers. In the early morning of the last day of November the Piazza Ucciardoni, we are told, "exhibited one of those sinister spectacles which remind one of the middle ages, or rather of the most hated tyranny." The police and the Bersaglieri were mustered in the darkness, and "four dim lights showed that in front of the prison carpenters were at work." And what were they doing? "The *Riformatrice della Società*, the guillotine, was being erected, and this morning"—shocking to relate—"the head of a man was severed from his body as a public example of moral education." It should be remembered that the poor man whose untimely death is so pathetically deplored had for several years belonged to a body of ferocious banditti, that the list of the victims whom he had helped to plunder and kill was a long one, and that the outrages in some cases had been of a particularly horrible kind.

It is of course impossible to imagine anything more sickening and monstrous than an attempt to excite public sympathy for such a vile and noxious brute as RIGGIO. Yet we are quite ready to concede to the humanitarians that there may be grounds on which his execution may justly be condemned. If the Italian Government does not follow up its severity against RIGGIO by equal severity against other malefactors of the same type, it will certainly lay itself open to the remark that it has killed a man to no purpose.

It was not worth while to cut off RIGGIO's head merely to prevent RIGGIO himself from killing any more of his fellow-creatures, if RIGGIO's companions are to be allowed to go on killing with, if possible, an enlarged impunity in compensation for this act of wholesome rigour. The justification for executing RIGGIO was to supply a warning to others. If his execution is to stand by itself as an isolated and exceptional incident, it will of course be regarded by his companions as only an accident, like the breaking of a branch on which one is climbing or a false step on the edge of a precipice. "Poor dear ALBERTO!" they will say, "was unlucky, and these things will happen sometimes. Still it is a risk that happens so seldom that we can afford to set it aside." Here we have the whole rationale of capital punishment, and if the soft-hearted philanthropists who, here as in Italy, are so eager to show their humanity in saving the lives of murderers would only take the trouble to think it over, it might do them good. As a rule, it may be assumed that the prospect of being hanged or beheaded does not operate as a strong inducement to commit murder. It is true, no doubt, that in some cases the murderer does not pause to reflect on the consequences of his crime or his chances of escape. Yet his death may be expected to suggest this wholesome train of reflection to other minds, and thus the sacrifice of one life may be the saving of many.

It should be observed, however—and this, in fact, is the point of the argument—that the punishment to be effective as a warning must be made as nearly certain as possible. If the chance of an Italian brigand getting beheaded is only the same as the chance of his breaking his neck by tumbling off his horse, brigandage will go on as briskly as ever. If the chance of an English murderer getting hanged is made equally uncertain, then murder may be expected to flourish in England. At the present moment it may certainly be doubted whether in this country capital punishment is so powerful a deterrent as it should be, and the reason is simply that the chances are all in favour of the murderer. To say nothing of the stupidity of the police, there are mad doctors, maudlin journalists, weak judges, sentimental juries, and imbecile Home Secretaries. The murder may be as clear as anything can be, but all sorts of excuses are suggested. The poor fellow was mad—indeed, the mere fact that he killed any one is a proof of madness—or he was provoked. A man has a bad wife; she is shrill, drunken, unchaste. Her husband cracks her skull as the best way of silencing her. Should the poor man be hanged for that? Certainly not, we should say, if you are of opinion that wives should be put to death without trial at the discretion of their husbands for bad temper and looseness of conduct. This week there has been a case of this kind in which the murderer has been spared, and the result will no doubt be that a good many other wretched women will be put to death for offences which, however aggravating, have not hitherto been supposed to require such discipline. The odd part of the matter is that it is the very people who pride themselves on their tender-heartedness and anxiety to save life who are the chief agents in encouraging murder by advocating the principle that murder may be committed with impunity. If a man cannot get on with his wife he can leave her; it is a curious development of humanity that he should be authorized to kill her.

SEASONABLE WEATHER.

THERE is a striking difference between the existing and the traditional estimate of an English winter. On the average of seasons the cold is, perhaps, less severe than it used to be; but the dislike which is felt towards it is certainly greater. The old notion of winter implied frost and snow without, but indoors the enemy was supposed to be hopelessly beaten. Roaring fires and abundant good cheer were told off to fight him, and it would have been treason to doubt that they would conquer. English pity was about equally divided between the inhabitants of more Northern countries, where cold was supposed to be irresistible, and the inhabitants of more Southern countries who never had the good fortune to be cold at all. Such articles as those which have appeared in the *Times* this week would have been impossible a century ago. The writer would have drifted against his will into such familiar themes as a bracing English winter, a fine old English

Christmas, the healthy glow that comes from battling with the cold, and all the other commonplaces of insular patriotism. Nowadays winter is not only no longer regarded as a friend, he is not even classed among enemies that can be met on equal terms. We cower before him as before a tyrant whom it is useless to resist. Occasionally, when his hand is more than ordinarily heavy, the victims may take courage to speculate whether there is any means of setting themselves free, but for the most part they have convinced themselves that submission is their truest philosophy.

Several causes have combined to bring about this change of temper. Something is to be attributed to the growth of town life. There is a dignity about winter in the woods and fields which deserts him altogether when he ventures under dripping eaves or upon half-thawed pavements. The difference may have been noticed during this last week by any one who compared his sensations in Hyde Park or Kensington Gardens with his sensations in Trafalgar Square or the Regent Circus. In the one case the snow was still white and hard, and the contrast, even with the dingy London trees, and the black water of the Serpentine, was picturesque and striking. In the other the snow had lost every trace of its original colour and texture, and had been converted into a more than commonly thick mud. Such a difference as this must by degrees influence the spirit in which people think of winter. It is impossible for a man whose business lies in London or Leeds or Manchester to remember that ten miles away the snow of yesterday, or the frost of last night, has given beauty to every feature even of commonplace landscapes, when he sees nothing but indescribable filth and wretchedness immediately around him. This inevitable disgust has been very much fostered by that better knowledge of what winter is like in really cold countries which has come with more extended travel. When Russia was an unknown land, and Northern Germany rarely visited in winter, Englishmen did not take in that the unpleasantness of cold weather in this country was largely due to the fact that it is not cold enough. By degrees, as the long frosts of Berlin and St. Petersburg grew more familiar to them, they realized how important it is in matters of climate to know exactly what it is that you have to prepare for. Even in London, if the snow in an ordinary winter did not melt for six weeks, life out of doors would become very much more bearable. Sledges would take the place of wheeled carriages, and, except for the few days of the final thaw, moving about would be smoother, cleaner, and less noisy than at any other time of the year. As it is, many winters go by in which a sledge could not be used at all, and even in exceptional years there is no possibility of counting on continuous frost for twenty-four hours together. Another discovery was that, though the cold in more Northern countries is greater than in England, it is much less painfully felt. The state of the thermometer inside the houses is a much more important consideration than the state of the thermometer outside, and in the former respect Russia or Northern Germany has an immense advantage over England. The cold may run riot out of doors, but it does not come into the rooms. The small annoyances of our English winter—the draughts, the bad fires, the cold passages, the change of temperature in passing from one room to another—are all unknown. It is no wonder that, as life with these irritating conditions removed came to be compared with life in a country where they are in full play for a large part of every year, the old admiration of an English winter gradually died out. A third cause which has contributed to the same result is a more accurate knowledge of the hygienic effect of cold. Before statistics were thought of, healthy people had everything their own way. If they said they found winter bracing, there was no appeal from their judgment. When death-rates came to be studied, another class of witnesses came in for a hearing. The world is not entirely made up of people between fifteen and forty with sound lungs and a brisk constitution, and the cold which is little more than a pleasant stimulant to them is in the highest degree injurious at the two extremes of life. When once it came to be known that a severe winter causes as many additional deaths as the most severe epidemic, the last delusion was dispelled.

It would be wrong, however, to suppose that it is merely our estimate of winter that has been changed. There can be little doubt that many of us feel cold more

than our forefathers did, as well as think more hardly of it. The modern English house is, except in a few special instances, a colder place to live in than the houses of a century ago. The reason of this is obvious enough. A cold house almost always means a badly-built house. Either the walls are too thin, or the woodwork does not fit properly, or the doors and windows are badly arranged, or the fireplaces are not constructed so as to give out enough heat. Of these defects, the first and last are the most universal and the most important. The last person consulted in building a house is usually the man who has to live in it. In a great majority of cases, at all events in towns, the occupier knows nothing about the construction of his house. It was built before his time, and as all houses look pretty much alike when they have once been inhabited, he has no means of informing himself upon the subject. Even when he has the means, he is not materially better off. He can, it is true, go and examine a half-built house with the view of taking it when it is finished; but when he discovers, as he certainly will, that the walls have not the thickness that will enable them to resist extremes of weather, he has not really the option of refusing it. If he does not take that house, he must take another in which the deficiency is equally great. There is virtually no competition among builders. Houses are too costly things to be built except when there is a fair certainty that they will be let. Take it or leave it is almost everywhere the alternative proposed by the builder to the tenant, and if the latter elects to leave it, he usually finds that it is only to incur the obligation of choosing whether to take or leave something exactly similar a few streets off. Consequently there is no motive for one builder to provide better houses than another, except such as may be supplied by a prudent desire to make the first outlay go as far as possible. But in London, unfortunately, any possible improvement that might be derived from this source is neutralized by the system of building leases. A house that will outlast his lease is a dead loss to the builder; his object is to find out as nearly as possible what expenditure of material will make his property saleable for the period that he owns it, and worthless after it has gone back to the landlord. He builds not for all time, but for an age, and with him an age means strictly a century less one year.

There is no present prospect, therefore, of our houses becoming better fitted to keep out cold, so far as their walls are concerned; but the case is not quite so hopeless as regards fires. Even this may seem too sanguine a statement, at the moment that the Council of the Society of Arts have reported that none of the new grates which have been exhibited and tested during the past year are worthy of the prize which they had declared their intention of awarding. It may be doubted, however, whether room grates are the exact direction in which improvement is to be looked for. After all, severe cold is but a very passing incident in our English climate, and except during severe cold the open grate will always be more popular than the close stove. Indeed it has so many advantages over its rival as regards ventilation, and consequently as regards health, that we should regret to see it generally superseded. Yet so long as the open grate is retained, it seems improbable that fires in rooms can be made to give out very much more heat than they do now. But there is nothing to prevent the hall and staircase and passages of a house from being warmed, like a greenhouse, by a stove placed in the basement; and if this were done, draughts from doors would be abolished, since the air outside the room might be kept warmer than the air inside, the heat within the rooms would be more equally distributed, since the further the inmates were from the fire the nearer they would be to some of the doors communicating with the warmer passage beyond, and one most fertile source of disease, the sudden change of temperature in passing from one room to another, would be entirely avoided. The man who will invent a cheap and satisfactory stove for warming the whole of what may be called the common land of every house may be pretty sure of reaping the reward of his labour.

ANTHROPOLOGY.

A COMMITTEE appointed by the British Association has drawn up a curious little volume intended to direct the researches of travellers in uncivilized countries. The book is divided into a hundred sections, each of which contains a brief

catechism to be answered by the intelligent observer. He is asked, for example, Whether cannibalism prevails? Whether, if not, there are traditions of its former prevalence? Who are the victims? With what ceremonies are they eaten? What is done with the bones? Whether the use of human flesh is confined to any class or sex, or whether it forms part of the regular food of the people? To obtain satisfactory answers to these and many other such inquiries would be of obvious importance, especially as the unsophisticated savage is rapidly becoming a purely historical character. The time at which the last red man will disappear from the North American continent may be calculated with little risk of error; and in many other parts of the world the only question is between annihilation and absorption. Some persons might urge that, if the savage is vanishing from the backwoods, he is being multiplied in Lancashire. Unfortunately the savage of civilization has no manners or customs to repay the investigation of others than philanthropists or police-officers. The member of a primitive community is, on the contrary, one of the most interesting of all objects of inquiry. So long as he survives we can transport ourselves into the dim ages of the past; we can see our remote ancestors face to face, instead of vaguely guessing at their habits from a few scattered relics. The interest of such researches is not purely antiquarian. Mr. Tylor and other writers have made even superficial readers familiar with the bearing of savage customs upon many phenomena of civilized life. And therefore it is clearly desirable that travellers should be prepared to direct their inquiries so as to elicit really valuable evidence.

We are beginning to recognize the truth, illustrated in so many different departments of inquiry, that many things which were once supposed to have been the product of direct invention have really been slowly and unconsciously elaborated by the instinctive activities of many generations. Down to the present century historians seem always to have fancied that the constitution of a country was invented offhand by some more or less mythical legislator, who worked out a complete code from abstract principles of reason. There is still a vague impression that such a thing exists as poetical or dramatic invention, in the sense that a poet creates a new story instead of giving a new dress to an old one. Slowly, and perhaps reluctantly, we are being driven to the conclusion that the faculty of reasoning plays a much smaller part in human affairs than we were once accustomed to think; and that the most original of mankind must generally be content to find some new application of an old principle, or to express a little better than others thoughts which are fermenting in thousands of minds. The individual is but the sum of his ancestors, with some slight and generally superficial modification; and it is true of all mankind, as of any particular race, that you have only to scratch the surface to discover the primitive savage. Moralists have indeed been much in the habit of insisting upon the resemblance in special instances without having hitherto made any great impression. We must all admit in general terms that the modern plan for settling difficulties by cutting each other's throats is a barbarous practice, not materially different, except in the appliances used, from the old methods of scalping and tomahawking. A great proportion of the activity of the most civilized races is spent upon producing wealth of no greater intrinsic value than the beads or shells which please a savage. We condemn savage tribes for the thoughtlessness which causes periods of plenty to alternate with periods of starvation; and yet we must admit that a large part of our own population is incapable of looking forwards for more than a few months. If the majority of mankind could ever be persuaded to calculate upon the natural consequences of their actions for as long a period as a year, the whole state of the world would be altered.

In another sense we might almost say that the race goes backwards as well as forwards. A great many of the queries suggested by the British Association are intended to throw light upon the origin of practices which still exist amongst us. The ceremony of marriage in the most civilized countries bears traces of the old habit of carrying off wives by force. The custom was probably adapted to a primitive state of society. When the form survived the reality, the world was certainly better in so far as marriage was arranged upon more equitable terms; but, on the other hand, one more utterly unreasonable practice was added to the customs of mankind. Every action, it is said, which now appears to be meaningless had once a meaning. It follows that a great part of our lives is occupied in doing something or other which is purely useless, because our remote ancestors did the same thing when it had some real use. The mass of observances which are purely conventional is thus continually increased by the innate conservatism of the race. We may account for everything, from the cumbersome machinery of constitutional forms down to the shape of our hats or the buttons on our coats, by the fact that there was once some reason for something of the same kind. We should think a man a fool who wore a great coat in the summer because he found it convenient in the midst of winter. Yet people boast of stuffing themselves with roast beef and plum-pudding under a tropical sun in Australia because their relations are doing the same thing to keep out the cold of an English Christmas. And it is perhaps still more absurd that we should dress ourselves in defiance of all comfort and all the laws of health because we have not imagination enough to construct a new form of garment. To sacrifice health to a false idea of beauty is absurd enough; but to sacrifice it to the false ideas of people who have been dead and buried for hundreds of years would be ap-

parently too absurd a proceeding even for human beings if we did not know that it constantly occurs. Nobody now supposes that a woman is more beautiful for having a waist like a wasp's or a foot too small for her stature. But our ancestors thought so; and we have acted on their principles for years after we knew them to be absurd. These are trite instances; but it would be curious to inquire how many practices of a more important kind are merely survivals on a large scale. To a savage tribe hunting was a necessity of life. Now it is rapidly becoming a purely artificial luxury. When the preservation of the race depended on its success in slaughtering wild animals, the pursuit was worthy of the best energies of the most active members of the community. But this seems at first sight a very bad reason for people who want a little fresh air and exercise to obtain those objects by the very roundabout method of galloping across country after a fox. We have sometimes thought that a dog must be a very unreasonable creature because, however fond he may be of the water, he will not go in until a stick is thrown for him, which serves no purpose when he gets it. And yet the dog is only acting upon the same principle as the fox-hunter, who would consider the notion of hunting for the sake of the game utterly preposterous, and would yet refuse to follow the amusement unless sanctioned by the conventional symbol.

It would be curious to inquire in what degree some other modes of obtaining pleasure are prompted by reason, and in what degree by a blind hereditary instinct. If human beings sat down to construct upon first principles the most rational modes of enjoying society, would they hit upon any of the practices which are now popular amongst mankind? They simply follow the precedents set by their ancestors, though they would admit, if questioned separately, that they were intensely bored by most so-called amusements. The anthropologist might find, for example, some curious subjects of inquiry in the habits of modern Londoners. He would ask why people come together in large crowds to small rooms where the atmosphere is bad, where there is no opportunity for rational conversation, and where there is no compensation in the shape of solid meat and drink. Is it a religious ceremony, or has it any political or social symbolism, or do people simply meet in crowds because, in a savage state of society, the gregarious instinct made any collection of human beings a pleasant relief to a solitary existence in woods, and people do what was done by their predecessors? Is not the stage, again, an instance of a survival? When people could not generally read, it was pleasant to come together to hear a poem declaimed, and of course it was all the better if the various characters could be represented by different persons. To the educated mind there seems to be something childish in the desire to have a concrete person dressed up like a king to help you to appreciate an expression of royal sentiments, though in simpler ages such a practice was natural enough. But it is difficult to explain, except on the principle of survival, the fact that civilized human beings should crum themselves together in an ill-ventilated room in order to hear animated puppets repeating verses which they could understand much better in the comfort of their own firesides. We might rise still higher and ask how many of some performances which are admitted to be essential to the welfare of society are determined, as to their form at least, by the imitative tendencies of the human race. The result, we may fear, would be that a judicious inquirer would find that we resemble savages in the circumstance that the greater part of our actions have very little cause beyond an instinctive disposition to do what has been done before us. It is undoubtedly very fortunate that people do not trust more to the delusive faculty which they call reason; and such an inquiry would probably produce a desirable feeling of humility.

THE DOCTRINE OF THE REFORMATION.

MR. BURT, in his speech at the Newcastle Conference of the Liberation Society, supplies us with a good example of those popular fallacies which are of the nature of half truths. Sir Henry Havellock, who goes in for theology and thinks some forms of theology right and others wrong, said that a second Reformation was needed. Mr. Burt, who despises all theology and thinks it an objection to a creed that it is three hundred years old, takes up the words of the Nonconformist baronet in a way which he could hardly have liked. According to Mr. Burt, "the truth that all theologians of every age and of every creed are slow to learn" is "that the human mind would not be crippled and fettered by creeds of any kind." The sentiment of course drew forth applause, and the speaker went on:—

Sir Henry Havellock had said that they required a second Reformation. He ventured to say that what they required was the doctrine of the Reformation logically carried out. What was the doctrine of the Reformation? The right to private judgment, free thought; and this was what they wanted.

One cannot get a better specimen of the way in which people talk who are not without some natural sharpness, but who are talking about things which they do not above half understand. We are always frightened when we hear about the logical consequences, the logical carrying out, of anything. We have learned by experience to look for one of those French sayings which are so painfully clear that a plain man cannot tell what they mean. But we allow that there is a sense in which, perhaps not the doctrine of the Reformation, but something or other to which the

Reformation gave start, does, when carried out somehow, whether logically or otherwise, lead to private judgment and free thought. The Reformation had in the end a good deal to do with the promotion of private judgment and free thought. Herein is the half truth which is contained in Mr. Burt's fallacy, and which has misled a great many people beside Mr. Burt. Mr. Burt says that the "doctrine of the Reformation" was "private judgment and free thought." He most likely thinks that Luther, Calvin, Cranmer, or anybody else whom he may take as the type of a Reformer, proclaimed the doctrine that every man might believe as he pleased and worship as he pleased, and be subject to no pains or penalties for so believing and so worshipping. This is really by no means an uncommon notion. But we need not say that every one who has the faintest glimmerings of knowledge about the history of the sixteenth century knows that the exact opposite was the truth. In the latter half of that century, two persons who cannot be supposed to have had any intercourse with one another, Akbar and William the Silent, did come to something like what Mr. Burt calls the doctrine of the Reformation. And, if either Akbar or William the Silent had legislated for England, France, or Germany, the religious affairs of those countries might have been settled in a way more likely to please Mr. Burt than the way in which they actually were settled. As it was, nothing could be more unlike Mr. Burt's ideal. Nothing was further from the thoughts of any party at the time of the Reformation than the proclamation of private judgment and free thought for every man. An oppressed party might now and then murmur something of the kind on its own behalf, but no party in power ever dreamed of allowing any right of the kind to a party weaker than itself. There never was any age in which the right of the civil power to regulate the religious affairs of its subjects was so strongly and so universally put forth. It was a doctrine which hardly could have been put forth for some centuries before the sixteenth. The questions which arise out of religious differences had slept for some ages. There had been an earlier time when they had been as fully awake as they were in the sixteenth century. In the fourth, fifth, and sixth centuries the questions of tolerance and intolerance were as important as they became again in the sixteenth and seventeenth centuries, and Valentinian and Theodoric forestalled the solitary wisdom of Akbar. But, when all Western Christendom acknowledged one standard of orthodoxy, the case was changed. There were doubtless at all times some who dissented from that standard of orthodoxy. They would be called Nonconformists now; they were called Heretics then. There were times and places, like Southern Gaul in the thirteenth century, where the heretics were pretty thick on the ground, and could muster a good deal of physical strength. Still, in those days there was only one way of dealing with Nonconformity. The Church declared who were heretics, and the secular arm made an end of them. If they were few, the civil power could see to them; if they were many, it might be needful to preach a crusade and send an army against them. It nowhere occurred to any man in Western Christendom either that different men in the same political community might lawfully worship in different ways, or that different political communities might set up different forms of worship within their own boundaries. An Albigenian meeting-house hard by the Catholic church, both of them being equally under the protection of the law, was a thing that no man dreamed of. And men dreamed just as little of a state of things in which this or that independent kingdom, this or that prince or free city of the Empire, should establish one form of religion, while the next principality or commonwealth established another.

The half toleration granted to the Jews was no real exception. The Jews were not heretics. They had not rebelled against the Church, because they had never belonged to it. They were in every sense, political and religious, strangers in every European land, and, with more than the disabilities of the stranger, they had also some of his advantages. We may say that in Western Europe there was no real exception to the rule. In Eastern Europe, in the lands which the Crusaders wrested from the Eastern Empire, there was another state of things. Catholic conquerors had settled down among Christians whom they called schismatics. Still their case was different from that of heretics in the West. The whole native population of Eastern Europe could not be dealt with like a few stray preachers of strange doctrines, or indeed even as the Albigenians were. The treatment of the conquered differed in different times and places. The Latin Emperor Henry deserves a place alongside of Theodoric and Akbar for despising national and religious prejudices, and putting Greeks and Franks on a perfectly equal footing. In the border lands of East and West, in the Sicilian realms where Norman Kings ruled over Greek and Saracen subjects, questions of the same kind arose, and toleration of the infidel was one of the crimes for which Frederick the Second tried to make up by persecution of the Christian heretic. But in the lands with which the question is really concerned, in the lands which were really touched by the Reformation of the sixteenth century, in Britain, France, Germany, and Scandinavia, questions of this kind did not arise at all. In all times before the sixteenth century the right of private judgment and free thought on the part of the individual member of the community was vigorously put down. The same right on the part of the political community itself, the right of this or that prince or commonwealth to establish one religion, while another prince or commonwealth established another, was a question which had not yet come into men's minds.

Now what was the real "doctrine of the Reformation"? What was the immediate change which the events of the sixteenth century made in the state of things which we have just described? Did the leaders of the Reformation proclaim, or did their work actually bring about, an acknowledged right of private judgment and free thought for every man? Not a bit of it. The change which was really made might be summed up by saying that it established the right of private judgment and free thought for each separate political community, but that it left individuals exactly as they were before. It established the powers of the civil magistrature in matters of religion as they had never been established before. Up to this time the theory was that the State simply lent its physical force to carry out the decrees of the Church. The Church declared such or such a man to be a heretic, and the State burned him. But now the State ceased to carry out the decrees of the Church as a matter of course. It took upon itself to decide whether it would cleave to the old Church or set up a new one. It was by no means inclined to let heretics off, but it took upon itself to define who were the heretics. Here in England Henry the Eighth burned Friar Forrest as a heretic for believing as everybody had believed a few years before. Presently Mary, or somebody in her name, burned everybody who did not believe as Friar Forrest had believed. Through all the changes under Henry, Edward, Mary, and Elizabeth the idea of legalized or tolerated dissent never came into any man's head. King and Parliament settled religion as they settled anything else; other people had nothing to do but to conform to what they made law for the time being. Among the many sovereign States of Germany things took a different course from what they took in the consolidated kingdom of England. Had the Imperial power been strong enough, one religion would have been forced upon the whole Empire. As the Imperial power was not strong enough for this, the right of establishing what religion it thought good was transferred from the Empire to each of its several members. A religious peace did not mean the right of each man to choose his religion for himself; it meant the right of the prince or senate under whom he lived to choose his religion for him. "*Cujus regio, ejus et religio.*" Toleration as a principle was nowhere acknowledged; if it anywhere existed as a fact, it was because of the accidental wisdom of this or that particular prince, or because in this or that place parties were so equally balanced that neither had any chance of rooting out the other. In Geneva, the holy city of one great body of Reformers, private judgment and free thought took the form of the burning of Servetus and the law which made it death to say more. In France a religious peace had, according to the different circumstances of the country, the same meaning that it had in Germany. It never meant the right of each man throughout the land to worship as he pleased. It meant the right of the Reformers to exercise their religion in those districts, towns, or castles, where they were too strong to be hindered from exercising it. La Rochelle might follow its own way; but it was as unlawful as before to set up a Huguenot conventicle opposite the towers of Notre Dame. Nowhere in the era of the Reformation was Mr. Burt's "doctrine of the Reformation" anywhere acknowledged. Toleration, so far as there was any, was local and incidental. The principle which really was established was that, instead of every King, prince, or commonwealth being bound to give the support of the civil power to one undisputed religious system, every King, prince, or commonwealth might choose which of several religious systems it would enforce upon its subjects.

Had the Reformation then, the Blessed Reformation, really nothing at all to do with private judgment and free thought? It had much to do with them in many ways, but not in the way which the random talk of Mr. Burt would imply. The immediate result of the Reformation was, in most cases, simply to put down one intolerant system and to set up another. But it would be a most shallow view to see nothing more than this in the Reformation. The causes and the results of the Reformation were far wider than the Reformation itself. Herein lies the half truth which Mr. Burt and others who talk like him have got hold of. Private judgment and free thought were in no sense the doctrine of the Reformation, but they were at once its cause and its result. Calvin had no respect for the private judgment and free thought of Servetus. Cranmer had no respect for the private judgment and free thought of John Bocher. Cranmer, above all, throughout life freely burned all who exercised their private judgment in a different way from himself, till he lost the power of burning others by being burned himself. But the position of Calvin and Cranmer was not the less the result of private judgment and free thought. By the exercise of their private judgment they came to certain conclusions, and, as they had the luck to get Kings and senates to adopt their conclusions, they had the pleasure of burning those who by the same process came to other conclusions. No King or Senate adopted the conclusions of Servetus or John Bocher; they therefore were burned; had they had the same luck as Calvin and Cranmer, most likely they would have burned somebody else. But this was a state of things which could not go on for ever. Granting that anybody should be burned—and Mr. Froude teaches us that some people ought to be burned—the adherents of the old, immemorial, in appearance at least unchangeable, system, the system which, if it sprang from private judgment, sprang from the private judgment of ages back, could burn people with a certain show of decency. But it was monstrous that men should burn others for doing what they had just before done themselves. When it was declared that Popes and General Councils were not infallible, it was soon found out that Luther and Calvin and

Craumer, that Landgrave Philip and Queen Elizabeth, that Convocations at Westminster and Synods at Dort, were not infallible either. The Reformation therefore, though in itself the most high-handed exercise of authority, did in its results strike a deadly blow at the principle of authority. Men who used their private judgment to crush the private judgment of others presently found that the private judgment of others was as little to be crushed as their own. When the claim of a universal Church to rule the consciences of all men was cast aside, the claim of this or that prince or senate to rule the consciences of men within a certain geographical limit could not long go on. The Reformation was the offspring of private judgment and free thought; it was the eventual, though the unwilling, parent of private judgment and free thought; what it did not do was to put forth private judgment and free thought as a doctrine. The Reformation took place because men's minds were astir, and it set men's minds astir still more. But it did so without professing to do so. The Reformation may fairly enough be said to have been the indirect cause of all the forms which private judgment and free thought have taken in later times. And in this way those forms may, for aught we know, be the logical carrying out of the doctrine of the Reformation. But most certainly private judgment and free thought were not the avowed or conscious doctrine of men who burned everybody who used his private judgment and free thought in a different way from themselves.

SETTING UP A BUTLER.

THERE are various forms of human suffering which must excite the compassion of any beings of a superior order who may have an opportunity of contemplating them. The good man struggling with adversity is proverbially a touching spectacle; but we are not at all sure that the good man struggling with the consequences of his own prosperity is not sometimes more deserving of commiseration, especially as his unhappiness does not usually excite much sympathy or pity among his friends. There are perhaps few kinds of misery so trying as that of the rising middle-class man who has been getting on in the world, extending his practice or his business, accumulating a comfortable balance, and laying up a stock of social consideration, and who finds himself on the brink of a great domestic revolution, which is the natural result of the good fortune which has hitherto been so sweet to him. He has of course been more or less distinctly aware since he started as head of a household of a gradual development of domestic we will not say comfort, and luxury, in the true sense of the word, would be still more out of place but perhaps we may say display. The snug villa, in its garden, at Tulse Hill or Holloway, where he began life with Arabella, has been exchanged for a more pretentious dwelling nearer the centre of fashionable life, first perhaps in Bayswater or Regent's Park, and then, as Arabella's views expanded, in the aspiring outskirts of South Kensington. The cook and housemaid of the primitive family have also been growing into a numerous retinue of female servants—cook and kitchenmaid, first and second housemaid, parlour-maid, nurse and under-nurse, and perhaps a boy. It is sometimes of the little things of life that one has most reason to be afraid, and if our friend had been wise, he would have had an uncomfortable presentiment when he saw the boy become a member of his establishment. The theory of development has undoubtedly its place in the domestic as in the animal world, and Wordsworth himself perhaps scarcely realized to the full extent all that is meant by the melancholy truth that the child is father to the man. To the eye of the social physician the irruption of the boy in buttons, or even, in an earlier stage, of the boy without buttons, who is surreptitiously introduced into the area to clean the knives and boots, is painfully ominous. Every doctor watches for such signs. It may be only a little flush or a scarcely visible pimple, but to the observant eye it betokens unmistakably what is about to follow. In a suburban house perhaps a boy does not much matter. There is a garden where he can be turned loose when not wanted indoors; or there is probably a pony-chaise, and he can make-believe to be useful to the groom. At any rate you know the worst of him. When he outgrows his jacket and trousers so that there is too much exposure of bare arm and dirty stocking, he must of course give place to another; but that other will only be a boy such as he used to be himself. The danger of the boy in a town house is that he is the thin end of the wedge—the almost inevitable precursor of a man.

It may be supposed that with the increase of the domestic staff a certain change also takes place in the life of the household. There are more courses than there used to be at table, evening dress creeps in, and the range of hospitality widens. The boy having been added at the tail of the establishment, another male is found to be indispensable at the head of it. In short, our friend suddenly awakes to the discovery that he is in that most distressing position which may be described as tottering on the verge of a butler. His wife is constantly pointing out to him that other people not better off than they are have a butler; that a butler at once steadies and gives character to a house, and is, in fact, a sort of social badge or symbol without which they can no longer hold up their heads among their friends and neighbours. Women servants may be all very well in their way, but then they are distinctively associated with mere *bourgeois* respectability. It is also hinted that a butler would after all be rather an economy than an additional expense. He would check the bills, keep

an eye on the other servants, and do many things which the master of the household is too much occupied to attend to. It is possible that this sort of argument may not carry very decided conviction to the mind of the person to whom it is addressed, but he cannot but feel that, however he may struggle and procrastinate, the question is already decided. Sometimes, of course, a man makes the plunge without thinking much about it, and he may even perhaps fancy that he will enjoy it. But to any one who reflects on all that is involved in the introduction of a butler into a house for the first time the prospect can hardly be contemplated without a pang. Hitherto he has been, under his wife, master in his own house. A woman cook is the highest person in his service, and personally he has nothing to do with her, though the mention of his name may sometimes be a useful resource to his wife when she has a difficulty with her chief domestic. If he wants anything done in a particular way he has only to tell his wife, who gives the necessary order. But now a new official is to be introduced under his roof who will entirely alter this state of affairs. A wife may manage a cook without troubling her husband, but he cannot escape the responsibility of himself looking after the butler. His domestic life suddenly falls under the shadow of a strange man who has ways and ideas of his own, and who, though nominally his servant, contrives in many things to make himself felt as master. Theoretically, of course the supreme authority rests with the employer; he gives his orders, and it is supposed that they will be carried out. But his sense of freedom in giving orders is apt to be seriously circumscribed by his consciousness that they will be sharply criticized in thought, if not in speech. A butler who finds himself in a house where there has never been a butler before has ample scope for a peculiar kind of tyranny. He has an experience of the rights and duties of butlers to refer to of which his master is destitute. Nothing can be more impressive than the solemn gravity with which, under the form of questions, he issues mandates to his employers, or the expression of melancholy surprise with which he listens to suggestions or remonstrances which reveal the depths of social obscurity in which his master and mistress must have passed their previous existence. Reminiscences of the liberality and splendour of houses in which he formerly lived supply a ready answer to all complaints. His Lordship, or Sir John, as the case may be, was content to write cheques for the wine-merchant without making fussy calculations as to the proper consumption of the quarter, or indulging in invidious suspicions as to whether a common St. Julien had not been substituted for Chateau-Margaux; nor did he demean himself by looking into the items of shopkeepers' bills, and comparing their prices with those of the Civil Service Stores. The butler's ideal of a perfect establishment is one in which the butler manages everything according to his own ideas. Now he is in a generous mood, and grumbles because there are not enough large dinner-parties and an overflowing table. Another time he sulks because he is done to death with too much company. The first principle of his system is that all transactions with tradesmen should pass through his hands, so that he may arrange for a nice little bonus for himself, in return for which he undertakes to defend the dealers when any question is raised about the quality of their goods or a doubt as to the fairness of their measure. The cellar is usually a sore point in domestic administration. The master likes to be sure that he gets the wines he pays for, and that they are reserved for himself and his guests, while the butler resents a suspicious inspection of the stock. In other days the master looked after his cellar himself. He took care that his favourite wines were lovingly bestowed, and, as he surveyed the store, indulged in pleasant anticipation of the day when he would have up some of his Comet port or '58 Latour. But now he is never sure what he has; bottles break, wines become sour or muddy in the most perplexing way, and at the most awkward times; and though the old-fashioned drinking-bouts have quite gone out, mysterious evaporation seems to equalize consumption.

It is hard to say whether the butler who is useless or lazy or the one who is too busy and meddlesome and wants to take everything on himself is more vexatious. In the one case the master is constantly occupied in looking after things which the butler neglects or in correcting his blunders. In the other case the master finds himself pushed out of the way, and forced to take things as they are provided by a superior power. His house is given over to a man who treats him as a lodger. A very good butler, who knows his business thoroughly, and knows that he knows it, is apt to be still and impracticable, and to presume on his experience. As a rule it is certainly a mistake to bring servants from a family of a higher class into one of lower position. A cook who has happened once to live with an Irish peer will ever after in moments of drunken depression bewail with tears the plebeian extraction of her new employer who has made his money in trade; and a butler feels that he has descended in the social scale since he left a titled house. But worst of all of course is the wandering butler who has been everywhere and with everybody, and who is perpetually being passed on from one place to another, whose complexion reddens and whose gait grows unsteady on critical occasions, whose spoons are always going astray, who brings the reek of tobacco to the breakfast-table and the odour of onions to dinner, and is discovered, after he has gone, to have forgotten to pay the bills for which money was given to him. It will usually be found that servants, though they have faults of their own, reflect the faults of their employers, and this is especially the case with the butler in a family of moderate means. In a great house, where there is a large retinue of servants, and

systematic organization is indispensable, the butler must necessarily be a man of good capacity and character; he occupies a distinct and well-defined position and is well paid. A butler of the inferior order, on the other hand, is too often required to combine the services of a menial with the management of many matters which require not only unexceptional integrity, but intelligence and business qualities. He is usually a common, ignorant man, and particularly susceptible to the temptations which surround him. He is probably anxious to marry, or, if married, to get settled in some business where he can live with his wife and children, instead of seeing them only by snatches; and he is therefore eager to snatch at perquisites and to put by money. He acquires a dangerous taste for good living, and has too many opportunities of indulging it. He is too much trusted, and too little respected, and generally he is underpaid. As a rule, it may be said that, unless a man has large means, he had better try, with his wife's help, to get on with women servants; and in any case there is obvious peril in handing over to a substitute, with few qualifications for the task, the discharge of duties which he ought to see to himself.

THE WESTMINSTER PLAY.

THE annual performance given by the Queen's scholars of St. Peter's College, Westminster, does much to keep alive in modern minds the knowledge of what manner of thing the Roman Comedy was. In reading many of the works of the playwright whose *Trinummus* is this year selected for representation, one might be disposed to think that Polonius was well within his tether when he asserted that Plautus was "not too light" for the players who came to Elsinore. If, however, some modern comedies appear brighter and more animated than the productions of Terence and Plautus, it must be remembered that the writers of those comedies had the teaching of several centuries at their back. That some modern playwrights have not turned the advantage of such teaching to the best account will be readily admitted. Most writers of comedy have in some measure profited by the previous existence of the Roman comedy. There is hardly a modern play in which there may not be discovered some device of the stage which is to be found in the service of one or other of the two best-known Roman dramatists. They, in their turn, had borrowed these devices, as indeed they did their whole plays, from the Greek. There is this difference, however, between the two cases. The Latin playwright prefaced his production by an acknowledgment of the source whence he had drawn it. In those days there must have been either more honesty or less craving for originality among authors. Anyhow the contrast in this respect between the two ages is curious. Formerly no slur was cast upon a piece by the fact that it was entirely taken from the Greek. It would be difficult to say how many original pieces of this age have owed their originality to original methods of translation. It is not easy to see why the borrowing of plots or hints for plots should be considered a sin. It is a practice which has been assiduously followed by many great writers. Not one of Shakespeare's plots was invented by the poet himself. Beaumont and Fletcher have borrowed not only plot, but language also, from Lucian in their *False One*, and Ben Jonson introduces an admirable translation of a whole satire of Horace in his *Postmaster*.

The *Trinummus* of Plautus, itself taken from the *Thesaurus* of Philemon, has supplied the three best-known languages of modern Europe with plays. From it Giovannina Cecchi took his *Nota*, Destouches his *Trésor caché*, and Lessing his *Schatz*. The plot of the piece is not ill constructed, and shows some knowledge of stage effect. There have been so many copies in various forms taken from different parts of it in the course of ages, that it would not be surprising if the original appeared a little dilapidated by this time. A good plot forms an excellent flight of stairs to the shrine of the drama; it is not surprising therefore to find it worn by the knees of anxious votaries.

It is a curious circumstance that from Lesbonicus down to Charles Surface a reckless, profligate, extravagant young man has always been the especial idol of writers of comedy. As the stage is supposed to be the looking-glass of the world, and, more than that, a magic looking-glass which shall not only show things as they are, but as they ought to be, this fact seems strange. What would the authors who have glorified their heroes in proportion to the worthlessness of their characters do if they met one of their pet creations in real life? Would they find no worse punishment for his follies and crimes than a caressing blow with a gold-headed cane and a fondly reproachful exclamation of "You young dog!"? Would they smile with delight at finding his utter want of principle redeemed by a rockless generosity which, put in exercise by a ruined man at the expense of his creditors, can hardly have much redeeming virtue in it? Would they finally reward his rakish career by entrusting him with an admirable wife and presenting him with "gold to a large amount" to celebrate his wedding? Clearly there is some hidden attraction in the character of a well-bred rake which has led many writers to glorify on the stage that which off it they would probably feel bound to condemn. It must be said, however, that Lesbonicus, the rake of the *Trinummus*, is not so bad as some rakes. It is himself, not his creditors, whom he threatens to deprive of all means of sustenance by a sudden act of generosity.

The piece is opened by a prologue which, as Canning said of his

prologue to *The Rovers*—"somewhat breaks the matter to the audience." It is spoken by two allegorical persons, Luxury and Want. The first three lines of the dialogue give some hint of the motive of the play:—

LUXURIA. Sequere hac me, gnata, ut munus fungaris tui.

ISOPHIA. Sequor: set tamen fore quem dicam nescio.

LUXURIA. Adest: nam ille sunt ades: i intro nunc jam.

The house into which Want is sent by Luxury formerly belonged to Charmides, a wealthy Athenian, father to Lesbonicus, the dissolute young man of whom we have already spoken, and to one fair daughter whose name does not transpire. Charmides, leaving the country on business matters, entrusted the guardianship of his son and daughter to his friend Callicles. At the same time he confided to his friend that in a certain part of his house was concealed a large sum of money; the "treasure" which gave its name to the original piece by Philemon. During the absence of his father, Lesbonicus, in order to supply his waning purse, put up the house for sale. Callicles the guardian felt compelled to buy it as the only means of keeping the treasure concealed in it under his own control, and thus fulfilling his duty to the absent Charmides. This transfer of property is supposed to have taken place just before the opening of the play proper, which takes the form of a dialogue between Callicles, the purchaser of the house, and "a damned good-natured friend," who has come on purpose to point out to him the depravity of his conduct in making a purchase from his extravagant ward. Callicles takes his unmerited scolding with a lamblike meekness, and when his friend calls him "homo nequam," he gives no stronger reply than "non istuc meum est." There is, however, some humour in the scene, notably in the invective against scandal-mongers with which the friend of Callicles concludes it. The next scene introduces Lysiteles, a young man of fortune in love with the sister of Lesbonicus, who remains invisible as well as nameless throughout the play. Lysiteles, without much trouble, persuades his unusually indulgent father, Philto, to undertake all the preliminaries of his marriage with a portionless girl, for it is expected that Lesbonicus, having reduced his possessions to nothing, will be unable out of that to raise a dowry for his sister. The preliminaries, however, are not easily arranged. Lesbonicus has still a field outside the city, and this he proposes to bestow as a marriage portion upon his sister. Stasimus, the shifty ready slave who, under various names, fills in Roman comedy the kind of place which Scapin does in French, overhears this proposal, and, knowing that his master's whole present revenue depends upon this field, he resolves to keep it in the family. To this end he gives Philto a truly appalling account of the peculiar properties of this field, which he asserts brings every kind of misfortune to its unfortunate possessors. Philto is so frightened by the recital that he resolves to do anything rather than be concerned with such a field, and thus the object of Stasimus is gained. His hurry to get rid of his master at the end of the scene is an effective bit of stage business.

Presently ensues a quarrel between the two young men, the one insisting upon giving his sister a dowry, the other refusing to accept it. The amount of shame which Lesbonicus seems to think will attach to him if his sister is married without a dowry is noteworthy. As in the case of most rakish heroes of comedy, his generosity is merely a form of selfishness. He refuses to let her marry Lysiteles, an excellent match, with whom she very likely was in love, under certain circumstances, because her doing so would make things unpleasant for him. Meanwhile Callicles the guardian has discovered the state of affairs, and resolved to present her secretly with a dowry out of the concealed treasure. How to convey it without arousing suspicion of this treasure's existence presents itself as a difficulty. Callicles, however, and his friend of the first act devise a crafty plan between them. They hire a "Sycophanta," one of the loungers about the Forum who in Dr. Smith's Dictionary are described as "happy compounds of the common barrator, informer, pettifogger, busybody, rogue, liar, and slanderer." This person they instruct to personate a friend who has met Charmides abroad, and is bringing from him sealed letters and a dowry for his daughter. A fitting costume is obtained by one of the conspirators from the "choragus," and the plot promises to work admirably, until, as the pretended friend of Charmides approaches his house in one direction, the real Charmides, unexpectedly returned, approaches it in another. Upon this ensues a scene which contains a good deal of humour. It may be observed that this scene has given rise to one in the *Suppositi* of Ariosto, and through that medium probably to the better-known scene between Vincentio and the Pedant in the *Taming of the Shrew*. Charmides has some difficulty in asserting his own identity, but is presently recognized by the slave Stasimus. On hearing from him of the turn which affairs have taken, the miserable old man falls into a swoon which, by contrast with the rest of the play, is a somewhat tragic incident, and reminds one of the author's line in the prologue to his *Amphitryo*:—

Faciam ut commista sit Tragico-comœdia.

The appearance and explanation of Callicles, however, sets things in the right track, and the comedy ends as comedies should end. It is needless to say that, not only is the virtuous Lysiteles rewarded by the hand of the girl whose dowry comes from the *thesaurus*, but a brand-new wife is also immediately discovered for the dissipated Lesbonicus. How many comedies since this one have ended with a double marriage?

Holes have been picked in the *Trinummus*, whose age alone might entitle it to immunity, on the score of the extreme im-

probability of some of its incidents. It has been observed that there is a gross want of likelihood in the meeting between the Sycophanta and Charmides, who would never have stopped to observe a stranger in the street before entering his house immediately after his return. As has been remarked on a former occasion, it should be remembered that Charmides is led to suspect the stranger of evil intentions towards his house—the house where the treasure is concealed. A better-founded objection is to Stasimus's loitering prolixity when delay involved danger to his back. It must be remembered, however, that Stasimus was not sober at the time. It may be supposed also that he was sharp enough to know exactly how far he might try his master's temper.

The acting of the play was well up to the mark. The "low-comedy" and "character" parts of Stasimus and the Sycophanta were rendered with considerable humour. The young men were personated with skill and spirit, the old with due discretion. Among these latter, the representative of Calicles was remarkable for his ease and his unusual capability of standing still. The part of Charmides contains in one scene remarkable difficulties, which were most creditably met. An improvement might possibly be made in one point of the grouping. When one of the characters is overhearing the conversation of others—a frequent situation—it would be well to put a little more life into his demeanour and attitude, care being taken at the same time to avoid restlessness.

The Epilogue, as of wont, deals satirically with passing events. There is much ingenuity in the consecutive stringing together of such apparently incongruous subjects as railway abuses, the competitive examination mania, the new pronunciation of Latin, and the Transit of Venus. The verses in which the clever conceits are clothed are neat and smart. The Prologue touched in appropriate and feeling terms upon the honours and deaths of old Westminsters, and other subjects of general interest.

THE PATENT-LAW.

THE Lord Chancellor has received a deputation from the Inventors' Institute on the subject of the Patent-law, has heard what the members wished to say, and has assured them that he takes great interest in the subject. It is now a year and a half since a Committee of the House of Commons made a Report on this subject, containing certain recommendations, and it may be supposed that the time has come for legislation upon the basis of that Report. We should have thought, indeed, that there need not have been any delay, because even those persons who desire to abolish all Patent-laws would probably concede that, if those laws are to be maintained, they ought to be amended. The deputation told the Lord Chancellor nothing that he did not know, or might not have known before. The arguments for and against Patent-laws are all collected in the two Reports of the Committee for 1871-2, and Lord Cairns has had as counsel and judge abundant opportunities of observing the absurdity and expense of the present system. When it is stated that the hearing of a patent case in Chancery took thirty-three days and cost 15,000*l.*, the necessity for some amendment of the law has been adequately demonstrated.

The proposed reform, like many others, resolves itself into the creation of several places with comfortable pay. The deputation proposed "a public department under a high official, to institute a preliminary examination into all applications for patents, so as to ascertain whether the proposed invention was new and related to something that was useful." It is expected that the fees payable on patents would cover the cost of this establishment, and if it can be rendered self-supporting, Ministers may easily reconcile themselves to the necessity of making several valuable appointments. It is also suggested that every patentee should be obliged to grant licences on "fair terms," and to decide what are fair terms would be another branch of business of the same establishment. It is urged that a complete and convenient Museum of Patents, like that at Washington, would be valuable, and that, for the relief of poor inventors, the fees on patents ought to be reduced. A member of the deputation observed that "the artisans of the Anglo-Saxon race were equal to any in the world, but it was necessary that they should have a fair start in the race of competition." It appears hardly worth while to occupy the time of the Lord Chancellor in listening to this kind of talk, particularly as he must have heard it all before. But we will assume that a Museum of Patents generally available would be a harmless, and probably useful, institution; and if it can be maintained out of fees paid by patentees, let it be established. It is said that, if patents could be had cheaply and easily, many frivolous patents would be taken out; but at worst they would only occupy space in the Museum. And there may be a variety of opinions as to whether a patent is frivolous. It is stated that a patent was granted in America for the fifth wheel of a coach, and, said a witness before the Committee of the House of Commons, "such a patent may not be very valuable, but I do not think it is likely to stand in the way of any other improvement that comes after it," and so it did not much matter whether it was granted or not. The same witness mentioned a patent for a spittoon, which in this country, he said, is not an important thing, but in the United States is of the utmost value, and many fortunes have been realized from spittoons. There are 15,000 patents granted yearly in America, and it is feared or hoped that under an improved system as many would be granted here. The Commissioners or Examiners would, we presume, have some discretion to refuse frivolous

patents, and, with that proviso, we do not see that an increase of the number of patents would be an evil. There are, undeniably, some strong objections to the system of granting patents, but if these objections be overruled, it will scarcely be contended that the system ought to be checked in its operation by unnecessary difficulties. Working-men in general appear to favour patents, and many instances might be produced in which they have derived benefit from the existing system. Mr. Mundella told the Committee, as the result of his observation, that every successful invention has conferred a benefit on the inventor and on the public, while unsuccessful inventions have only conferred loss and injury on the patentees. In the hosiery and lace trade Mr. Mundella says that nine out of ten inventions have been made by workmen. He found a working-man with a little circular machine in a wretched garret. He was ill, full of rheumatism, and almost starving, and yet he had got a capital machine. Mr. Mundella saw at once that it was a good invention, took the man into his own employment, patented the machine, and gave the inventor one-third of the profit, which amounted to 300*l.* Many similar instances might be given, and they go far to show the value of a Patent-law. On the other hand, it has been urged with much force that a kind of epidemic of inventions sometimes breaks out, and that if one man is not seized with the malady, another man certainly will be. Those who hold this view are obliged, however, to admit that inventions really worthy of the name are sometimes made and deserve to be rewarded; and when they concede that they go a long way towards admitting the utility of a Patent-law. Thus, a witness mentioned the article of sulphuric acid, and he thought that, if M. Gay-Lussac had not invented the process which he patented, somebody else would. But the same witness, referring to the "invention of sending messages by electricity," thought that inventions of that class ought to be well rewarded. The difficulty would be to define the class and to settle the reward. The Committee, after hearing many able expositions of these conflicting views, decided that the privilege conferred by patents promotes the progress of manufactures, by causing many important inventions to be introduced and developed more rapidly than would otherwise be the case. The same privilege leads to the introduction and publication of numerous improvements, each of a minor character, but the sum of which contributes greatly to the progress of industry. The Committee further resolved that, in the absence of the protection of patents, the competition of manufacturers amongst themselves would doubtless lead to the introduction of improved processes and machinery, but that it would probably be less rapid than under the stimulus of a Patent-law. They further resolved that the granting of pecuniary rewards could not be substituted with advantage to the public interest for the temporary privilege conferred by letters-patent.

The Committee further resolved that the existing Patent-law and its administration are in many respects defective, and require considerable improvement in the interests of the public, of manufacturers, and of inventors. They recommended that protection for a limited period, and dating back to the time at which it is applied for, should only be granted for an invention on its nature and particular points of novelty being clearly described in a provisional specification, and upon the report of a competent authority that such invention, so far as can be ascertained by such authority, is new and is a manufacture within the meaning of the law. This recommendation appears so reasonable that any man unacquainted with English habits might wonder that a year and a half should be allowed to elapse without attempting to carry it into effect. As we have already said, there are two opinions whether there should be a Patent-law, but there cannot be two opinions whether, if there be such a law, it ought to be made reasonable and practically useful. The deputation to the Lord Chancellor repeated the recommendation of the Committee, with a few flourishes about the Anglo-Saxon race, and the Lord Chancellor cautiously intimated his hope that the Government might be able to place the Patent-laws on a better footing than that on which they now stand. One feels tempted to address Sir Antonio Brady in Haulest's words, "To this effect, sir, after what flourish your nature will." Enforce the recommendations of the Committee and introduce embellishments about the Anglo-Saxon race *ad libitum*. Your purpose is so reasonable, that you cannot quarrel with it by any caprice in the execution.

It is certainly not the fault of the deputation that they could find nothing to say that was at once new and important. In fact, the subject has been thoroughly discussed. The time for talk has passed, and the time for action has more than come. Mr. James Howard informed the Lord Chancellor that, while taking out a patent in America, he was struck with the superiority of the American system to our own. The Lord Chancellor is probably too busy to read blue-books, and, even if he knew, he could not consistently with politeness have informed Mr. Howard that the story he was about to tell had been a year and a half in print. But then it is in the very words in which Mr. Howard told it to the Lord Chancellor. The process which is called ripening of public opinion has now been adequately performed in reference to the Patent-laws, as is shown by the fact that a deputation can only repeat, with additional solemnity, recommendations which have been urged a hundred times before. There was indeed one item of novelty produced by this deputation. An International Congress on Patent-laws was held at Vienna, and the representative of England at this Congress presented a copy of his Report to the Lord Chancellor. It may perhaps suffice to endeavour to bring about an amendment of our own law before troubling

ourselves as to the laws of other countries. But recent experience does not inspire confidence in "international" proceedings of any kind. If foreigners see their way to obtain useful concessions from us, they will doubtless go into Congresses with alacrity; but otherwise not. An assimilation in the law and practice of various countries as to inventions is certainly desirable, and it can probably be obtained if this country is prepared to make unlimited concessions.

"EMINENTLY RELIABLE."

WE have always had a strong conviction that an educated Englishman—that is, an Englishman who has been at school and is supposed to have been educated—who can bring himself to use, we cannot say the word, for it is not a word, but that absurd and stupid vulgarism, "reliable," must have a screw loose somewhere; and a curious illustration of this theory has just occurred. The other day the Rev. H. Temple West wrote a letter to say that a statement which he had made, and the truth of which had been challenged, was based on authority which was "eminently reliable." What Mr. West meant, and, if he had been able to write the English language correctly, would have said, was no doubt that his information rested on authority upon which he thought he could rely; but he made the mistake of applying to this authority an adjective which less improperly might have been applied to himself. A reliable person, if such a phrase is admissible at all, is clearly a person who is able to rely, and not a person who is capable of being relied upon. Mr. West would certainly seem to have a remarkable faculty of reliability, though the visionary nature of what he relies upon has been only too clearly demonstrated. He has now had brought home to him in a particularly unpleasant way the difference between "reliable" and trustworthy, and it may be hoped that both his syntax and his manners will thereby be improved. However, we had better go back to the beginning of the story, and exhibit in chronological sequence the various incidents of the clerical comedy which has just been played for the amusement of the public at a very dull season.

It appears that at a recent meeting to discuss the affairs of the Church, Mr. West, in order to show how little was to be hoped for from the Bishops when the Church was in danger, made some startling revelations as to the secret history of the Public Worship Act of last Session. It is known that Mr. Gladstone was very much opposed, among other things, to the clause in the Bill allowing an appeal from a Bishop to an Archbishop, and when it was passed in the House of Commons an attempt was naturally made to get rid of it in the House of Lords. Mr. West here gives us a little glimpse behind the scenes. Mr. Gladstone, he said, went to his friends the Bishops of Ely and Winchester, and told them, "If this question as to the Archbishops is carried, then I am perfectly free as to Disestablishment." This very much alarmed the two Bishops, and telegrams—so Mr. West's story ran—were at once despatched to "the absent members of the Episcopate" entreating them to "Come up and vote on the appeal; Disestablishment touched by it." He went on to say that to this appeal one prelate, whose name he would not mention, replied, "Very sorry; can't come; have got a garden-party." And that, Mr. West added, pointing the moral of the story, "was the grave way in which their Lordships regarded the interests of the Church." The story was received with laughter by the meeting, and was probably regarded as only a humorous way of saying that some of the Bishops were not quite so zealous in supporting the Church as they should be. Mr. West's speech, however, got into one of the religious papers, and was thence copied into the profane organs of opinion. Here it attracted the attention of the Bishops, who have perhaps no time to read religious papers. The Bishop of Oxford, though not personally referred to, assumed that he was included among the absent members of the Episcopate who were alleged to have received the famous telegram. Admitting that he was absent at the time in question, he denied that he had ever received any telegram, or had even heard of one being sent to any of his brethren. Next day the Bishop of Winchester, who had been expressly named by Mr. West, came forward with a still more indignant contradiction: "Whether Mr. West," he said, "heard or invented this"—that is, the story of the telegram and the garden-party—"I have no means of knowing; but I do know that it is untrue." The Bishop must have meant that the story was untrue as far as he was concerned—that is, as far as the alleged sending of the telegram was concerned; but he can hardly have intended to pledge himself for the whole of the Episcopate Bench.

On the following day, the Bishops of Oxford and Winchester having repudiated any connexion with the matter, the Bishop of Peterborough, another of the absent Bishops, published a correspondence which he had had with Mr. West, and which must have left that gentleman in a very confused and uncomfortable condition. Dr. Magee first wrote to Mr. West to know whether he had been correctly reported in the *Church Times*; and, if so, on what authority he had made a statement which, as far as he (the Bishop) was concerned, was absolutely untrue. To this Mr. West replied that he thought he was in the main correctly reported, and that his authority for what he had said was "eminently reliable," but he respectfully declined to give it. He added that he did not intend to refer to "all the absent members of the Episcopate." Upon this the Bishop of Peterborough proceeded to

turn up his sleeves and to administer the castigation to which he thought the culprit was entitled, and it must be admitted that nothing could be more thorough or artistic. Each cut is planted exactly in the right place, and one can almost fancy one sees the wales rising in purple ridges under a succession of extremely vigorous and hearty strokes. The Bishop begins by remarking that Mr. West seems to consider himself justified in bringing a public accusation against a limited number of persons whom he had carefully and unmistakably described in general terms, and then in refusing to give his authority on the ground that no names were mentioned—"a refinement in the art of false accusation more to be admired for its ingenuity than imitated for its morality." And then he goes on to show that, whatever his intention, Mr. West in point of fact did refer to all the absent members of the Episcopate; and he winds up with an expression of regret that a clergyman of standing and character should have placed himself "in the humiliating position of having made a public accusation couched in studiously offensive terms, which he has neither the ability to prove nor the candour to withdraw." And having thus whipped the offending child, the Bishop plants him in homely fashion on the cold pavement of reflection. It would appear that, under the influence of this smarting discipline, Mr. West has been led to reconsider his views as to what constitutes, in his ungrammatical jargon, an "eminently reliable" authority. He has now discovered by painful experience that an authority may be, what he calls, reliable without being such as any one is able to rely upon. "On reading the Bishop of Winchester's letter," he says, "I at once endeavoured to produce evidence of the truthfulness of my statement. I regret to say that I am unable to produce that evidence, and so must be content to remain in the position of a man who, on authority which he believes to be sufficient, has made a statement which he is unable to substantiate."

The position in which Mr. West thus exhibits himself is obviously not a particularly dignified or enviable one, but his blundering is no doubt sufficiently accounted for by that mental confusion which is also betrayed by his use of the word "reliable," without supposing any serious moral delinquency. The difficulties in which he has entangled himself are a very good illustration of the way in which "good things" get about, and the danger of taking them up too seriously. The story of the Bishop who could not come to the defence of the Church because he had to make talk for young ladies at a croquet-party was of course intended as a sort of comic version of Nero fiddling while Rome was burning, and as a passing joke might have been overlooked. If Mr. West, when the truth of the story was questioned, had explained that it was only a humorous echo of the light gossip of the day, and that he did not insist upon its literal accuracy, there would have been no more to be said. On the other hand, if Mr. West meant it seriously, he should have taken pains to verify its truth, and it is evident that, on his own admission, he neglected to do so till too late. There are generally a number of good stories in circulation which may be used very aptly to enliven an argument, but which it is perilous to accept as genuine history. Moreover, in acknowledging that he has no authority to produce, Mr. West should have extended the apology which he makes to the Bishops of Winchester and Ely to the other "absent members of the Episcopate" who were equally implicated in the story which he has been the means of spreading. While, however, Mr. West has certainly, as he admits, placed himself in an indefensible position, it may be doubted whether there was really any necessity for the warmth of indignation with which the Bishops have repudiated a "shave," which was perhaps hardly worth their notice. It is strange to find so small a matter exciting so much anger in celestial minds. A little more philosophy would perhaps have tempered the expression of their wrath. After all, there will, we fear, still be people capable of believing that the Bishop who had a garden-party, and, like the man in a more solemn parable, couldn't come, is not a myth, but a reality. Stories of this kind are like the dust of the road, which is sure to be blown about whenever there is a little wind, and which is least irritating when taken quietly and good-naturedly.

WINTER EXHIBITIONS.

WE are again met by the difficulty of determining what is an exhibition and what is a shop. The line of demarcation between the two is becoming year by year less clearly defined. For example, we enter certain so-called Winter Exhibitions in which the pictures are removed as soon as sold. The most marketable commodities are naturally first hung so as to attract the eyes of customers; then the blanks on the line occasioned by purchases are from time to time filled up by works which lay on the day of opening a little in the background, and afterwards there always remains a relay of further products in the cellar or the garret ready to keep the Gallery going through the season. A catalogue is found favourable, if not essential, to this sort of trading. Confidence is inspired when a subject or a master is put deliberately into print; but the visitor soon finds out that the names and numbers are in confusion. Sometimes his difficulties in the way of identification have been kindly diminished by manuscript interlineations made by the proprietor or his clerk; but just in proportion as the speculative Gallery is securing a commercial success, does the catalogue of yesterday become a thing of the past. Now such undertakings—which of late are on the increase—being

little else than shops in disguise, the question arises whether they ought to obtain more notice than the rooms of auctioneers. In their favour it may be pleaded that the works are usually well selected, that the arrangements are judicious and in tolerable taste, and that the public do not show themselves loth to appreciate the good fare which tempts their pockets. In contrast are those Winter Exhibitions which, instead of being under the direction of dealers, remain in the hands of artists, and for these last most sympathy is usually felt. Indeed a dealer may in these times almost consider himself an ill-used man; he is pointed to as a being who does not so much promote as prey upon the rising and struggling talent of the day. And we trust the period may never come when artists will not be strong enough to maintain independent exhibitions on their own account; for, notwithstanding the notorious jealousies and rivalries in the profession, artists are the best judges of good art, and the most generous in dealing with the least successful of their brethren, and even the want of business habits which tells sometimes against the success of these independent exhibitions may be passed over leniently as among the faults which lean to virtue's side. We have already noticed the Dudley Gallery; to the list of genuine artists' exhibitions wherein the price paid by the purchaser suffers no deduction at the hands of a middle tradesman may be added those of the Institute of Painters in Water Colours and the Society of British Artists. We are sorry not to be able at present to include the Old Water Colour Society in this category, inasmuch as the usual exhibition is this season delayed by the erection of a pretentious façade to the Gallery.

The Winter Exhibitions now open comprise a total of more than two thousand works, of which upwards of nine hundred find a place in the spacious Gallery of the Society of British Artists. As to the last, we are bound to say that we have never seen so many pictorial platitudes congregated in one spot; the amount of canvas spoilt and paint wasted shows how disastrous it is for youths to enter the art profession when destitute of talent. And the saddest part of this long-established exhibition is that the old members seem past praying for, while the younger aspirants do not see the need of close study as the preliminary to an assured career. Thus one of the cleverest pictures of the season, "Ecclesiastics" (231), by Mr. Calthrop, lacks drawing in the hands and care in the details; the noble Gothic cloister, with venerable monks in procession, affords a capital opportunity for a striking pictorial effect, but the characters are over-drawn; they are as exaggerated as the monks of M. Gustave Doré; the artist had the power to carry his work further, but he apparently preferred to stop short in order to save himself trouble. The following pictures may be enumerated as fairly good in their way:—"Preparing for a Festival" (62), by Mr. J. H. Walker; a scene from *Iphigenia in Aulis* (171), by Mr. Alabaster; "Girl with Strawberries" (192), by Miss M. Backhouse; "Autumn Idleness" (208), by Mrs. L. Jopling; "The Bandit" (256), by Miss G. Cruickshank; "A Quiet Pool on the Ilgwy" (82), and "The Mawddach Valley" (173), by Mr. James Peel.

The ninth exhibition of "Sketches and Studies" by members of the Institute of Water Colours is neither better nor worse than its predecessors. Again the complaint is heard that finished drawings vastly preponderate over genuine artists' jottings taken on the spot. Sketching, in the old sense of the word, is in fact fast becoming an extinct art, except among amateurs; the preliminary studies made of the figure and the tentative feeling of the way step by step to complex compositions—practices common among the old masters in the thorough student times—are now obsolete. We fear too that commercial considerations prevent artists from showing what they cannot sell to most advantage; a drawing doctored in the studio is naturally more dressy and presentable than a thought roughly noted down at the moment of inspiration; yet one such impulsive product, instinct with intention, is worth a whole gallery of mediocre drawings done drowsily between wake and sleep. As a favourable exception we gladly point to Miss Thompson's "Sketch for a Figure in a Drawing of the 10th Bengal Lancers at Tent-peering" (351). This lady, who, it will be remembered, made a *coup de force* in the last Academy Exhibition, was certainly not suffering from reaction or collapse when she threw off with dashing hand this Bengal Lancer rushing headlong at full speed, neck or nothing. This brilliant impromptu carries all before it; no horse in the circus is swifter; no trooper firmer in saddle; no Janissary of old more stern in resolve. The artist proves her knowledge and power by leaving this "sketch" simply as it was first struck off. We need not say that sight could not alone have sufficed; a horse tearing along at any number of miles an hour cannot be drawn in transit. This sketch is necessarily an effort of memory, and the accumulative product of persistent observation. We have heard the usual objection made to the action of the steed; but the artist is probably herself the best judge of horseflesh; and on a previous occasion she was able to defend herself on the moot question of how a horse manages to move at all. Yet we think she has made a mistake in submitting to public view that essentially embryonic effort "Charge! A reminiscence of the Life Guards at Wimbledon" (314). This is every way below the mark of the well-trained battle-painters in Paris. It is understood that Miss Thompson's election into the Institute was not of her own seeking; the honour was accepted with an explanation that her present commissions would preclude her from preparing any work expressly for the exhibition. We can but wish that other artists would give like gleanings from their portfolios. In this Gallery the screens are often favoured

with interesting waifs and strays of genius; thus, in addition to the contributions of Miss Thompson, appear some original sketches by Mr. Tenniel for the cartoons in *Punch* (313, 317, 318). What is meant by the word "finished" we do not quite understand; we would rather have seen these drawings in their first estate; the finish is now rather too much that of a lithograph; the pluck and the spirit which characterize the pen-and-ink designs of Leech are wanting. But much to be commended as unusual in this often lawless sphere of art are the correct, and even the severe, drawing of the figures, the symmetric balance, the compactness, and concentration of the composition. Few designers have had so happy a knack of concisely telling a story, or of neatly pointing a moral within the narrow compass of a page. It would appear, too, that Mr. Tenniel composes, at least occasionally, the piquant letterpress which in these cartoons fits so aptly the illustration, the one accentuating the point and amplifying the meaning of the other. Thus below the cartoon of Mr. Disraeli, laughing jeeringly, and of Mr. Gladstone, frowning sternly, we read the following:—

The Two Augurs.

DISRAELI. I always wonder, brother, how we chief augurs can meet on the opening day *without laughing*.

GLADSTONE. I have never felt any temptation to the hilarity you suggest, brother, and the remark savours of flippancy.

The number of foreign pictures which come to try their fortune in London is ever on the increase. We noticed in a former article the French Gallery in Pall Mall, and Mr. McLean's collection in the Haymarket. To these we now add the New British Institution, Old Bond Street, in which Belgian pictures preponderate; the Society of French Artists, New Bond Street; and the Flemish Gallery, King Street, Covent Garden. This last, the most recent of speculations, includes artists of all nations. In these and other like Galleries the contributions often meet the eye as old acquaintances. Pictures in these days are accustomed to make the tour of Europe; they pass from hand to hand as a sort of paper currency, to be changed on favourable occasions into gold or silver coin. One reason, we imagine, why this traffic is on the increase may be that there is more margin left for profit; dealers manage to buy cheap and sell dear; a principle which Adam Smith taught as a first maxim in political economy, and therefore, we presume, also in successful picture-dealing. Moreover, the derangement of national commerce and the loss of private fortunes during the late war have doubtless brought to London a great influx of pictures and picture-dealers. The consequent advantages and disadvantages are about evenly balanced. Certainly the best of our English artists do not suffer under the competition, but those in the second class are weakened. Another point for observation is that the dealers find it good policy to bring from time to time new aspirants into the field. Thus, when they have got up a ruin for MM. Corot, Daubigny, Isabey, Ribot, Robert Fleury, Alfred Stevens, Troyon, Toulmoche, Willens, Ziem, and others, they next advertise unknown artists as favourite pupils or as the great men of the future. By these mercantile expedients it is to be feared that the standard of foreign works is under constant process of being lowered, and with it the standard of public taste. On the other hand, the average merit of English pictures is known to be yearly rising. On the whole, we think English art a better investment than Continental.

Once again M. Gustave Doré forces himself on our notice; the fresh importations from Paris lose none of their power of attraction for London sightseers. M. Doré has never been quite a prophet in his own country, he fails at home to attain the highest distinction. Why is it, then, that "Christ leaving the Pretorium," "Christian Martyrs," "The Dream of Pilate's Wife," "The Massacre of the Innocents," and "The Soldiers of the Cross," please the British public? One reason is that the majority of people know no better; so long as they receive pleasurable sensations they are satisfied, without caring to analyse causes or effects; they do not stop to ask whether the forms are incorrect or ignoble, whether the details are slurred, or whether the sensational incidents, the surprises of light and the violent contrasts of colour, have not been got at the cheapest cost of study. Yet these considerations, which affect the judgment of artists, may account for the humble position hitherto held by this too brilliant painter in Paris. But the public at large continue notwithstanding to be attracted by compositions illumined by footlights and arranged as drop-scenes on the stage. To deny genius to this artist were to go too far; our objection is, and always has been, that he does injustice to his powers; he could "do better if he would take more pains." "The Massacre of the Innocents," a subject which specially needs to be treated with moderation, is a medley and an extravaganza made all the more obnoxious by its monstrous size. Vast scale—the lowest of expedients—is the common device of barbarous nations. But a great artist can be grand even in miniature—a secret which M. Doré has still to learn. He holds indeed the ordinary canons of art in absolute contempt, and yet the materials he uses are commonplace. "The Dream of Pilate's Wife" recalls in its chief character the well-known stage scene of Lady Macbeth walking in sleep, with the addition of a full-fledged angel, and the intrusion of a cross on an inaccessible summit illumined as by the lime-light. There was once a machine for grinding out poetry; M. Doré must be in possession of some such patent for his pictures. One of the least objectionable of these assailable compositions is "The Soldiers of the Cross." The conception is sufficiently imposing; countless multitudes file in long array among the hills and valleys of Palestine; the panorama is Miltonic. This and ana-

logous scenes, especially some grand agglomerations of mountains, torrents, and pine forests, prove M. Doré to be a poet. It is a pity that he interweaves into his finer fabric so much fustian.

THE THEATRES.

DURING this week Shakspeare has resumed possession of Drury Lane Theatre, and the dreary monotony of grand spectacular drama has been relieved by the performance of three plays which have been for long unseen upon those boards. It seems strange that the lessee, with several competent actors in his company, should persist in denying them proper scope for the exercise of their talents. The notion that a play of Shakspeare will not nowadays attract without spectacle is easily answered by observing that processions and scenery *ad libitum* may be exhibited in almost any of his plays, and neither of these adjuncts is necessarily exclusive of good acting. We believe that the attraction of *Richard Cœur de Lion* rather failed latterly, and it is wonderful that the manager did not introduce, as he easily might, some variety into his programme. If this were done on only one night in the week it would afford to residents in London the opportunity of going occasionally to this theatre. The grand spectacle of the season will bear at most a single visit.

The choice of the *Merry Wives of Windsor* for Mr. Anderson's benefit was not particularly happy, and we doubt whether the production of the same play at the Gaiety Theatre with Mr. Phelps as Falstaff will be a profitable experiment. The adventures of Falstaff in this play are not comparable in interest to those of Gadshill and Shrewsbury, and the fun which depends on the Welsh parson and the French doctor is somewhat tedious. Mr. Anderson, however, played not only Falstaff for his own benefit on Monday, but also Polonius on Tuesday, and Mercutio on Wednesday, and he played these three dissimilar parts equally well. It would be strange if an actor who played Othello and Orlando under Mr. Macready's management of this theatre some thirty years ago could not do as much as this; but if Mr. Anderson is content to bluster in King Richard for three continuous months, people may begin to think that he can do nothing but make a noise, and that would be a great mistake. He has the frame on which a magnificent Falstaff may be built, and his face and voice adapt themselves well to the part, but perhaps he showed more fully his capacity as an actor in the secondary parts in which he afterwards appeared. It is a lesson for younger actors to see a veteran like Mr. Anderson doing his very best in such a character as Polonius, and yet doing it unobtrusively. The success of his Mercutio was unmistakable, and, like every good actor of the past, he made the audience regret that inexorable necessity kills this lively gentleman in the third act. The performances of Tuesday and Wednesday were for the benefits respectively of Mr. Creswick and Miss Wallis, who, with Mr. Anderson, have contributed whatever dramatic element there was in the spectacular entertainment of the last three months. Mr. Creswick appeared as Hamlet, and the comparison which he thus challenged with Mr. Irving will not, we think, be disadvantageous. So much nonsense, to speak plainly, has been written about Mr. Irving, that people will perhaps hear with surprise that there is another actor who in his great part is not so very far behind him. We think, however, that Hamlet is not a part eminently suited to Mr. Creswick, and he is at some disadvantage compared with Mr. Irving in point of age. It must be added that his Hamlet is more "stagy," while Mr. Irving shows more independent study. Mr. Creswick was supported not only by Mr. Anderson in Polonius, but also by Mr. Henry Marston in the Ghost, a part in which that veteran actor excels. Without approving the levity of the expression, we may repeat a remark which was actually made, that "the Drury Lane Ghost beat the Lyceum Ghost into fits." The performance at Drury Lane, taken as a whole, was as good, or nearly as good, as that at the Lyceum, and had the advantage of a larger house. The inexorable demands of pantomime expel Shakspeare from Drury Lane after the present week, and therefore there can be no further opportunity of convincing the public that more than one actor can play Hamlet tolerably. Mr. Creswick naturally desired that his own son should play at his benefit, but by putting him into the part of Laertes he gave inconvenient prominence to the fact that he who was playing Hamlet is no longer a young man. In the fencing scene, the Queen's remark that Hamlet is fat and scant of breath is only too true, and when father and son meet point to point, it is manifestly any odds upon Laertes. We had occasion lately to speak of this fencing scene at the Lyceum, and we spoke in terms of general and very moderate commendation. If we had spoken more particularly, we should have said, what will be approved, we think, by every competent observer, that such merit as there is belongs wholly to Laertes. It is manifest that Mr. Irving has not taken the trouble to realize in practice that which he may be supposed to know theoretically, and exactly the same remark might be made upon Mr. Creswick. An impartial critic might be puzzled to award the palm for awkwardness between these two aspirants to the highest honours of the stage. Of the two young men the Laertes of Mr. Leathes is superior to that of Mr. Creswick, jun., but both suffer from the unskilfulness of their opponents. The trot at which Mr. Creswick advances to grapple with his son is about as unlike the movements of the fencing-school as anything that can be conceived. The absurdity is the more glaring because of the disquisition on exel-

lence at weapons which immediately precedes the match. At both houses, on observing how "short" Hamlet goes, a prudent spectator would proceed to hedge his money.

Miss Wallis, who appeared as Juliet on Wednesday night, gave perhaps a better impression of her talent by her acting of the part of Mrs. Ford on Monday. Besides Mr. Anderson in Mercutio, she had the help of Mr. Ryder in Friar Laurence, in which part his excellence is well known. He, like Mr. Marston in the Ghost, appeared "for this occasion only," but it may be supposed that the manager might obtain the assistance of both these valuable artists if he desired it, and he probably would desire it if he found that the public encouraged efforts to produce adequate representations of standard plays. Unfortunately every actor of any capacity desires to have a theatre to himself in which he may be undeniably chief, and may enjoy the undivided applause of so-called critics. The example of Mr. Anderson in undertaking secondary parts may help to bring about a more healthy practice, and it may be hoped that the manager of Drury Lane Theatre will be encouraged by the experience of this week to infuse a little more novelty into his programme for next season. If Mr. Halliday or anybody else can construct another grand spectacular drama out of the works in prose or poetry of Sir Walter Scott, the manager is of course at liberty to deal in the commodity which pays him best. But when it begins to pay him not quite so well, he should have some variety in store. It would be easy, for example, to produce *King Henry IV.*, in which Mr. Anderson and Mr. Creswick would be certain to support creditably the parts of Falstaff and the King, and there could be as much accessory splendour as the manager chose to pay for. Poetry and pageantry are not necessarily inconsistent, and if the public taste demands Shakspeare at Drury Lane Theatre, this week's experience shows that an efficient company may be collected without difficulty.

We wish rather than hope that Mr. Phelps and his associates may make the *Merry Wives of Windsor* an attractive play at the Gaiety Theatre. The production of a play of Shakspeare at this house to-night is noteworthy, even if it be only as a stopgap in the absence of Mr. Toole. Last Saturday afternoon Miss Helen Faucit appeared as Beatrice in *Much Ado About Nothing* at the Haymarket, and that useful actor Mr. Creswick was Benedick. On Thursday an efficient company, comprising Mr. and Mrs. Kendal, produced *As You Like It* at the Crystal Palace, and during the same week there have been five nights of Shakspeare at Drury Lane, and *Hamlet* is to be performed every night until further notice at the Lyceum. Next week, of course, Shakspeare and everything else must give way at the Crystal Palace to pantomime. But in due season we may expect to see the series of comedies continued. As the regular audience at the Palace is to some extent the same, the performances are necessarily varied. Any manager who does not insist on a long run deserves encouragement.

Among the few successful novelties of the season must be mentioned Mr. Gilbert's little piece called *Sweethearts*, which begins the evening at the Prince of Wales's Theatre. The manager of this house earnestly, but ineffectually, desires that the audience could find it convenient to be seated before the curtain rises. The nuisance of late arrivals is probably incurable, and nowhere can it be experienced in greater perfection than at the Lyceum, where the scene between Hamlet and the Ghost is nightly spoiled by it. If it is worth while to see *Hamlet*, one would think it must be worth while to see the whole. Mr. Gilbert's "dramatic contrast" is followed at the Prince of Wales's Theatre by *Society*, the first of those comedies in which the late Mr. Robertson so pleasantly represented the manners of our time. Paternal or maternal government has advanced so far in London that the "owl's nest," if it exists, must now be cleared out punctually at half an hour after midnight, and the habit of resorting to such a place for beer or brandy and water after a ball is as obsolete as arrest for debt, which was a favourite incident in the comedy of our fathers. The lesson of the Gaiety Theatre makes the curious announcement that he will open the Holborn Amphitheatre to-night as a "cheap and comfortable West-end theatre." We doubt whether the most spirited and capable of managers could make Holborn the West-end, but by all means let us have as much cheapness and comfort as we can get. The high prices of London theatres are mainly fixed nobody can exactly tell why. One or two small houses with exceptional reputation have even ventured to raise their terms above the others. But in general prices are absurdly high, looking at the character of the entertainment. It would be far better to have two persons in the house at half-a-crown each than one person at five shillings, because any play goes much better with a full house. As some leading members of the Gaiety company are to be transferred to the Amphitheatre, the performance is likely to be up to the average, and as the prices will be lower, a real cheapening will be effected.

REVIEWS.

MARTIN'S LIFE OF THE PRINCE CONSORT.*

MR. MARTIN has accomplished the first portion of his difficult task with a success which could scarcely have been

* *The Life of His Royal Highness the Prince Consort.* By Theodore Martin. London: Smith, Elder, & Co.

anticipated. His biography of Prince Albert would be valuable and instructive even if it were addressed to remote and indifferent readers who had no special interest in the English Court or in the Royal Family. Prince Albert's actual celebrity is inseparably associated with the high position which he occupied, but his claim to permanent reputation depends on the moral and intellectual qualities which were singularly adapted to the circumstances of his career. In any rank of life he would probably have attained distinction; but his prudence, his self-denial, and his aptitude for acquiring practical knowledge could scarcely have found a more suitable field of exercise than in his peculiar situation as the unacknowledged head of a constitutional monarchy. He was content to dispense with popular fame, and to wait patiently for opportunities of acquiring solid power. There can be no better illustration of the advantages of hereditary royalty than the Prince Consort's identification of unwavering attachment to the Queen with single-minded devotion to the national welfare. Personal loyalty was in his case wholly indistinguishable from public spirit. As a wise and thoughtful master of a house, he found it necessary to be also a dispassionate statesman. Happy in the unbounded affection and confidence which he inspired at home, he was singularly fortunate in his early political teachers. Baron Stockmar, his first political instructor, and for many years his judicious adviser, never ceased to present to him a high standard of responsibility; but he probably learned more from the English Ministers with whom he first transacted business than from any professed tutor. Lord Melbourne, whose affectionate interest in the Queen extended to her husband, if he cannot be counted in the first rank of statesmen, was a thorough Englishman and a consummate man of the world. When he left office in 1841 Lord Melbourne, with characteristic plainness of speech, told the Queen that he had thought her early praises of the Prince overstrained, but that he had found she was perfectly in the right. Sir Robert Peel, who soon overcame the coldness with which he was at first regarded at Court, was not only the ablest Minister of his time, but the most unselfish for himself and for his party. In the eloquent words of the Queen, he was "a man of unbounded loyalty, courage, patriotism, and high-mindedness." During his five years' tenure of office Prince Albert had constant opportunities of studying in its best form the art of government, which in a free country consists not only in the production of beneficent measures, but in the direction of public and Parliamentary opinion. Baron Stockmar, who, notwithstanding his familiar knowledge of English affairs, always regarded them from the point of view of a foreigner, in a letter to the Prince Consort blamed Peel for having done nothing during his term of office to increase the influence of the Crown. Prince Albert, with sounder judgment, replied that even in the agitation caused by the repeal of the Corn-laws there had been a widespread feeling that, "amid all the general confusion and heat of party, at least one person has remained calm and free from party spirit, that person being the Queen." In the same letter he adds, "To my mind the exaltation of Royalty is possible only through the personal character of the Sovereign. When a person enjoys complete confidence, we desire for him more power also and influence in the conduct of affairs. But confidence is of slow growth." The Prince was perhaps ambitious, and, if he had lived, he would have become the most powerful person in England, although he would have effaced himself, exercising his authority in the name of another. In the precocity of his early manhood he had been admitted by grey-haired statesmen into the inmost secrets of politics and diplomacy, and from the first he took pains to form and express on behalf of the Sovereign an independent opinion on all important questions. As he grew older, he accumulated vast experience as a Minister who was never out of office. In a few years more he would have outlived his early political teachers and associates; and he would have possessed almost a monopoly of uninterrupted official traditions. While he was still young, Foreign Ministers proceeding to their posts were often astonished by the useful information which the Prince communicated to them on the private history and personal tendencies of the Courts to which they were accredited. The Prince's reputation, as was natural where public display was impossible, followed at a distance the progress of his character and the increase of his knowledge. It was known that every able man who was admitted to his society spoke highly of his powers and attainments; but the statements of courtiers and of the occasional frequenters of a Court are naturally accepted with a large deduction from their value. The vulgar prejudice against foreign influence from time to time revived among the ignorant part of the community, and those of a higher rank were sometimes irritated by the misdirected adulation which attended the Prince's less serious exertions. The laborious attention which was devoted to the great affairs of England and Europe would have been better appreciated if injudicious flatterers would have been less eager in glorifying the exploits of South Kensington. Nevertheless the general belief in the merits and in the beneficent influence of the Prince Consort was steadily growing, and by a natural process it expanded into sudden maturity when his fatal illness surprised the whole country with a feeling of dismay. If the Prince had then recovered, he would probably have been afterwards exempt from shallow depreciation, as he had already outlived harmless satire.

*Virtutem incolumem odimus,
Sed vitam ex oculis querimus avidi.*

In judging of the letters and memorandums on various subjects

which are incorporated into Mr. Martin's narrative, it must be remembered that they were never intended for publication. A Memorandum intended for the King of Prussia on the means of promoting German unity, and a Memorandum to Lord John Russell on the proposed mission of Lord Minto to Italy, are State papers of a high order. On both questions the Prince differed in opinion from Lord Palmerston, with whom he seems never to have felt entire political sympathy. They agreed in wishing well to the efforts which were about that time made in different parts of Italy to introduce a more Liberal form of government; but while Lord John Russell and Lord Palmerston proposed to give direct encouragement to the Italian Liberals, Prince Albert held that it would be better to warn Austria against interference in the internal affairs of the Papal States, of Tuscany, and of Rome. The result proved that the Prince was justified in his belief that the policy of the English Government would be misunderstood, and that the visit of a Cabinet Minister to Italy would be thought more significant than his recommendation of moderate counsels. The proposals included in the German Memorandum have since become obsolete and inapplicable; but the paper is interesting, not so much for its contents as on account of the Prince's reception of Stockmar's severe criticism on his interference in German affairs. Prince Albert considered it hopeless to destroy the adverse influence of Austria; but he wished that Prussia and the minor Princes should systematically augment the power of the Diet, and extend the area of the Customs Union. Lord Palmerston, although he favoured the cause of German unity, not unnaturally desired to preserve English trade with those States which had not yet adopted the prohibitive tariff of the Customs Union. Baron Stockmar had not seen the Memorandum when he addressed the Prince in terms of warning and almost of reproof. His first objection was weighty, and perhaps conclusive:—"A Prince of your political position ought, as an unvarying rule, to abstain from doing what is superfluous." It was not advisable that the virtual representative of English Royalty should address himself to a great question of policy in the capacity of a German Prince. The rest of the criticism forms a solitary exception to the spirit of the general correspondence. For once Baron Stockmar was dealing with a question in which he took a deeper interest than even in the welfare of his pupil. The most constant and loyal of personal adherents, he had been a German before he became the confidential adviser of King Leopold, of Prince Albert, and of the Queen. He now observed that the Prince, having left Germany in early youth, could have no sufficient knowledge of the wants and desires of the country; and he added that, as a cadet of a reigning House, the Prince was specially disqualified to form an impartial judgment. "None are so ignorant as our princes of what is going on in Germany, and hence their deficiency in just insight into their own true interests. This ignorance makes them cling blindly to their class prejudices and hereditary relations, and see in what is demanded of them in the real interests of the country only lawless desires on the part of the people and mischief and danger to themselves." The territorial sovereignty of the German princes had, as Stockmar showed, been originally founded on usurpation, and "it is not to be denied that public opinion among the middle classes in Germany is now anti-dynastic, and it is the existence of this opinion which creates the events and suggests the warnings which I have made bold to express." As an author, as a rising statesman already experienced in great affairs, and, above all, as a member of one of the most illustrious among the great historical families of Germany, Prince Albert might have been excused for some passing irritation against his austere censor; yet his answer begins, "I have duly received your letters, and I thank you for them with all my heart." "I quite understand that my announcement of a plan of regeneration has alarmed you, and I must acknowledge the weight of the reasons which you adduce as to my qualifications for calling such a plan into existence; only I think you have been misled by the expression, regeneration-plan." Prince Leiningen, whom he had consulted, had anticipated Stockmar's anti-dynastic views; and Prince Albert concurred in the same opinions, although he had confined himself in the Memorandum to the single object of adding strength to the Diet. The Prince's candour and good temper, and his steady concentration of mind on the main issue, are more admirable than the acutest of treatises on German affairs. It may be incidentally remarked that Mr. Martin's versions of the large portion of the Prince's correspondence which was written in German display a rare mastery of the idioms of both languages and of the art of translating. But for Stockmar's didactic and sententious method, and his habitual use of philosophical terminology, his letters might be attributed to an Englishman; nor is it possible to distinguish between Prince Albert's English and German letters. Mr. Martin has published felicitous translations from many languages; but he has seldom achieved a more difficult feat of the kind than in making Stockmar's style intelligible to English readers.

As it was an old legal maxim that these could not be a demurrer on a demurrer, it may perhaps be a literary canon that criticisms ought not to be criticized; yet it may be allowable to regret that nearly all the notices of Mr. Martin's book have assumed the form of abridgments. Graceful extracts from confidential letters, and touching domestic anecdotes, perhaps form the most popular portions of the biography; but when they are displaced from the context, injustice is done both to the narrative and to the character which it illustrates. Summaries of the chief events of Prince Albert's life are comparatively dull in themselves, and yet they diminish the interest of the fuller record. Mr.

Martin is not a compiler or an annalist, but an accomplished literary artist, who has deliberately made a selection from the rich materials at his disposal for the purpose and with the result of reproducing the definite impression which the study of his subject had made on himself. It is an unavoidable drawback from the merit of the picture which he has drawn that it was from the necessity of the case without shadow. The biographer was not himself personally acquainted with the Prince, and he has derived the greater part of his information from an authority which could not be, and ought not to have been, impartial. It may be conjectured that the faultless hero of an affectionate imagination was in truth subject to but few and venial defects. He may have been but in part to blame for the undoubted fact that, notwithstanding his extraordinary merit, he was never thoroughly popular. An unsleeping sense of duty and responsibility rarely finds expression in a genial and hearty manner. An observant courtier used to say that the Prince would be popular if he would shake hands without sticking his elbow close to his ribs. The symbol of imperfect cordiality, if not highly refined, was at least intelligible. Grave statesmen who discussed with the Prince business of high import, and men of science who found that he comprehended their larger theories and understood their technical language, were probably unconscious of the coldness of manner which was sometimes resented by a proud and punctilious aristocracy. It was impossible that on his first arrival the Prince should be thoroughly at his ease in an unfamiliar society; and shyness and stiffness tend to outlive the occasions by which they were at first explained and excused. If the Prince had grown old in his adopted country, any early dryness would have gradually relaxed, and the assumption of dignity which may formerly have seemed necessary to repress intrusion would, if it remained, have suited graver years. The position of a Prince just emerged from boyhood at the head of society in a foreign land was, if not unnatural, at least in the highest degree exceptional and artificial. For the capricious oscillations of popular favour Prince Albert was scarcely responsible. His domestic virtues were cordially recognized, and his activity in promoting exhibitions and schools of design was applauded by that part of the community which is tolerant of plausible innovations. On the other hand, it was suspected, without any reason except that of his foreign birth, that he despised English prejudices, and even that he was too ready to consider Continental interests. The craziest delusion of a credulous rabble found vent during the Crimean War in a sudden and unaccountable rumour that the Prince Consort had been sent to the Tower. Soon afterwards a peer was found to ask in the House of Lords whether the Prince was in the habit of seeing the despatches which were submitted to the Queen. Lord Aberdeen's reply that of course he saw them, and that he would continue to see them, at once silenced captious criticism and popular clamour, as Virgil's pinch of dust quieted the turbulence of the bees. If Prince Albert had any defect except imperfect graciousness of manner, it has been successfully concealed. Painters and sculptors were not unanimous in their estimate of his taste in their arts; but it would appear from a letter of Mendelssohn's, quoted by Mr. Martin in an appendix, that the Prince was both a sound musical critic and a skilful performer. It is not known that he had either considerable literary attainments or a love of literature. At Bonn he obtained the reputation of being an excellent fencer; and he was a fair rider and a good shot. His more serious merits have been partially obscured by the standard which he himself established. The position which he adorned and employed for the public good was the same in which a hundred and fifty years before Prince George of Denmark passed through obscurity to oblivion. In early youth unbounded facilities of enjoying luxury and splendour never for a moment diverted Prince Albert from the course of voluntary and laborious duty. Rare powers of acquisition, and an intelligence worthy of his conscientious resolution, enabled him to reach and to maintain the level of his exalted career. No man made fewer mistakes of judgment, and his disinterested zeal in the service of the Crown and the country was never at fault. In all the relations of domestic life he seems to have been perfect; but private goodness ought not to be celebrated so prominently as to distract attention from success in a larger sphere of action. Mr. Martin has not, like some of those who have published extracts from his work, confined his attention to the annals of the nursery or the boudoir. His biography will be one of the sources of information which will be used by future historians.

Another character will rise, if possible, in general esteem, through the worthy record of a life inseparably associated with her own. The extracts which Mr. Martin has been allowed to make from the Queen's letters and journals, though they are designed only to illustrate the history and character of the Prince Consort, have an independent interest of their own. The glimpses of a domestic life as beautiful as that of an idyl have been universally appreciated. Her Majesty's minute and picturesque account of her visit, in company with the Prince, to his house at Coburg would be interesting if it were the diary of a private person. The judgment which she formed of the characters of some of her Royal visitors, and especially of the Emperor Nicholas, have a still higher value; and her political utterances, though her opinions may have been cultivated and moulded by the Prince, are not those of a merely receptive intellect or of a neutral character. No more queenly sentiment has ever been expressed than in a letter to her uncle King Leopold written in April 1848. The Orleans family

had been driven from the throne; as the Prince wrote shortly before, at a time when rumour exaggerated events in themselves sufficiently alarming, "European war is at our door, France is ablaze in every quarter. . . . The Republic is declared, the army ordered to the frontier, the incorporation of Belgium and the Rhenish provinces proclaimed." Seditious demagogues were about in the following week to hold a meeting which, as they hoped, would lead to a revolution; and "from the first," as the Queen wrote, referring to her recent confinement, "I heard all that passed, and my only thoughts and talk were politics. But I never was calmer and quieter or less nervous. Great events make me calm; it is only trifles that irritate my nerves." The courage which rises in the presence of danger, the presence of mind that is steady and confirmed by doubt and anxiety, are qualities which become a throne.

MURRAY'S HANDBOOK OF ROME.*

IT is commonly understood at Rome that the real author of this book died lately at a very advanced age. As the book is anonymous, except so far as its preface is signed by initials, we might, by a kind of legal fiction, have held ourselves in no way bound to take any notice of this fact. But the fact is well known, and our only object in mentioning the book at all is to make some suggestions for the improvement of the twelfth edition, which, as it is also understood, is shortly forthcoming. What we have to say we shall therefore say from this point of view only. We point out the faults of the present edition in the hope that by so doing we may do something towards making the next edition better.

The first thing to be done is to have the book thoroughly revised and largely rewritten by a real scholar. The book, as it stands, has no pretensions to scholarship; it does not rise above the level of a *cicerone* of the higher class. As containing a great mass of information in a shape in which it may be used at the moment when it is wanted, it is most useful to those who can correct it for themselves when it goes astray. But it is highly dangerous for any one who gives it the implicit faith which a great many of those who use it cannot help giving it. The author was clearly a man wholly of a past generation, one who had no sympathy with, and very little knowledge of, the researches of modern scholarship. Like most of his class, he had a distinct dislike towards the results of German research, results which at once shocked his prejudices and were beyond his understanding. When a man speaks slightlying of "Germans," and especially when he talks of "the German school," we know at once what to think of him. And another thing to be taken care of is that whoever is set to write the book afresh shall be a friend of Italy, and not an enemy. A Handbook ought not to show a political bias; especially it ought not to show a political bias hostile to all progress and improvement. The Handbook, as it stands, shows over and over again, by the most ludicrous signs, that its author was one who grudged Italy her freedom and unity, and even grudged her the possession of an intelligible coinage. The preface speaks of "a careful revision made on the spot to the latest period"; but that revision seems commonly to have stopped at some point earlier than the last deliverance of Rome. Here and there a change has been made to bring the description into harmony with the state of things which began in 1870. But such changes have clearly been made with a heavy heart, and commonly they have not been made at all. The result is actually a picture of ludicrous inconsistency. We shall give some other instances as we go on; a most characteristic one is in the description of the Quirinal Palace. The fact could hardly be concealed that that palace is now the palace of the King; but the careful revision on the spot down to the latest period did not get rid of the incongruous statement, true doubtless in the days to which our *cicerone* clearly looked back with regret, that, in order to see the inside of the palace, application must be made to "the Pope's *major-domo*!"

This ignoring of the actual state of things runs through the whole book, beginning with the preface, dated in 1872. We are there told that among the additions to the present volume are "chronological tables of the Sovereigns who have ruled over Rome from Romulus to Pius the Ninth, and of the principal events during the Republican period." It would seem then that in 1872 there were people who believed in Romulus and who had never heard of Victor Emmanuel. But, on looking to the chronological table itself, things are not quite so bad as this. A list of Popes, from St. Peter in A.D. 42 to Gregory the Sixteenth in 1831, shows not a single sign of emotion except when the writer stops to mark the "fabled Pope Joan." We have not one word about the doings or sufferings of any earlier Pontiff, but, when he reaches Pius the Ninth, we get a burst of rhetoric and lamentation:—

The present Pontiff has already attained the 26th year of his long and eventful reign, longer than ever reached by any of his predecessors in the Chair of St. Peter. Rome, occupied by the Italian army, September 20, 1870, with which ends the temporal power of the Holy See. Deposed of his states, and the greater part of them seized upon by King Victor Emmanuel in 1870.

One might be tempted to say that this kind of writing is too full and too impassioned for a chronological table, and not quite grammatical enough for a narrative in which we look for

* *A Handbook of Rome and its Environs*. Eleventh Edition, carefully revised on the spot to the latest period. London: Murray. 1873.

verbs and nominative cases. But all that is needed will be for the reviser to remember to scratch out this little outpouring, and to continue, as is done in Bâdiker's Handbook, the list of Emperors, which somewhat funnyly ends with Nicephorus in 802. 1872 was also an odd moment to put in for the first time a list of the chief ceremonies which the Pope used to perform in times past, into the middle of which it is found needful to thrust a paragraph to say that "the grandest of them have been suspended during the Pope's pleasure since the occupation of Rome by the Government of Italy." If our *cicerone* were not so very solemn, we should suspect him of a satire on the Bishop who wilfully shirks all his accustomed duties in the hope of persuading himself that he is in prison. And it is also rather queer to choose the same moment for putting in a long story about the privileges and precedences of the unimportant people who at Rome still call themselves Princes and Dukes. To be sure, the author had among the Roman nobility "a friend, the talented head of one of its most illustrious families," from whom he received a note at the end of which the writer finds it necessary to say that "most of the things of which he has been speaking have been swept away," and to add the expression of his own hope that, "for the sake of the religion at the head of which his Holiness is placed, he will not abandon the capital of Christianity for a foreign land." Perhaps, if he did, the rules about admission to the Vatican galleries and to St. Peter's crypt would be made less absurd than they are now. Some judicious reviser will doubtless strike his pen through all this twaddle, and put instead a rational account of the present condition of Rome. Johnson thought it hard to settle the precedence between a louse and a flea, and it is no less hard to settle the precedence between a Pope's bastard and a Jesuit's banker. But, if a subject of lamentation is needed, it might be worth while to lament that the ancient titles of Senator of Rome and Gonfaloniere of Florence have given way to the monotonous and unmeaning *Sindaco*. The functions of the chief magistrate might have been altered in any way that was found needful; but he might surely have kept his name. Such changes make us tremble lest a day should come when the Lord Provost of Edinburgh, the Portreeve of Langport, and the Bailiff of Dursley, may all be constrained to become Mayors.

It would be more important for the reviser, whoever he may be, to cut out the foolish remark upon the great *Beschreibung der Stadt Rom*. We are told that "its systematic opposition to all those who preceded in the study of the topography and determination of the monuments, in unsettling the mind of the visitor, takes away much of his interest in the sites of classical antiquity with which he is surrounded." That is to say, great scholars like Niebuhr and Bunsen did not greatly trouble themselves with the gabble of Italian *ciceroni*. Presently "persons unacquainted with German" are sent for "a clear and impartial account of the views of the archaeologists of the *Beschreibung*" to the article on Rome in Dr. Smith's Dictionary—that is, to Dr. Dyer, who believes in Romulus. We are further told that Mr. Burn's *Rome and the Campagna* is "more or less indebted for the information it contains to this Handbook." It will be better for the next edition of the Handbook if it is more indebted to Mr. Burn. And his criticisms on Mr. Parker are rather amusing:—

We cannot concur, in speaking of the works upon Roman Archaeology, in a statement of this author in one of his recent pamphlets, that, amongst the "numerous works on the antiquities of Rome, not one was written in an archaeological point of view," nor in his general estimation of the labours of the most celebrated of the living Roman archaeologists.

Now it is plain that Mr. Parker's censure of those who had gone before him was so far unjust as it took in the scholars of Germany and England; but it is equally clear that one drawback in Mr. Parker's researches has been that he has paid, not too little, but far too much, attention to those whom the Handbook calls "celebrated living Roman archaeologists." What is really needed is for Mr. Parker's theories, which have much to be said for them and much against them, to be tested by some competent scholar, and for a summary of the results to find their way into the next edition of the Handbook. The reviser who corrects these greater matters may also spend a minute or two in translating some of the odd statements about coinage to be found in the accounts of excursions in the neighbourhood of Rome. Thus in p. 373 we are told that a carriage to go to Tivoli and back costs "five to six *scudi*." In p. 393 donkeys from Frascati to Tusculum are made to cost "three and four *pauls*"; and in p. 435 there is a man at Veii who endeavours "to exact a *dollar*." As intelligible money had come in at Rome long before the Papal Government came to an end, we can only complain that the writer's numismatic archaisms do not go back far enough. If we are not allowed to reckon by *lire* and *centesimi*, we claim the right to reckon by *sesterces*.

It follows, almost as a matter of course, that one to whom the results of German research were simply things to be sneered at has gone wholly wrong on the Capitoline Hill, misplacing the *Arx* and the Temple of Jupiter Capitolinus in the old blundering fashion. The plan and description of all this part of Rome is thus made nearly useless. Indeed the book needs to be recast almost everywhere. A good deal has been found out at Rome since 1872, but a good deal that was known in 1872 is not at all clearly set forth. Nowhere is justice done to Mr. Parker's researches among the early walls, which are not the less valuable in themselves because their author has thought good to hide his own light under a bushel by wild talk about wolves and *pomeria*. It is most im-

portant that this part should be done by some one able to balance both the strong and the weak parts of Mr. Parker's theories. It would be well also to have some parts looked over by some one who really understands the history of architecture. No help at all is given to the student in this matter. Yet it would be a real service to point out how much may be learned from a systematic study of the various forms of capitals to be found in the Roman buildings. Nothing better dispels the superstitions of the old classical school, or shows how easily and naturally Roman architecture was developed into Romanesque. Thus in p. 196 the remains of the *Emporium* are slightly noticed, but without the faintest feeling of its importance in architectural history. Here is a range of arched doorways and windows which, if they were found anywhere north of the Alps, we should at the first glance set down as Romanesque work, most likely of the eleventh or twelfth century. They really belong, not, as the Handbook tells us, to the first or second century of our era, but to the second or third century the other way. They show the essential identity of the true round-arched style in the days before it had put on the Grecian mask and in the days after it had put it off again. After this, it is not wonderful to read, in the account of Diocletian's Baths:—

The ornaments of the baths and the style of the whole building indicate the decline of art; the columns did not support the continuous horizontal entablature of the more ancient buildings, but sustained a series of lofty arches resembling the basilicas of later times.

Then comes something from Forsyth about Michael Angelo "reforming the rude magnificence of Diocletian." This would seem to mean that Diocletian, in his baths at Rome as well as in his palace at Spalato, made the same great advance, the greatest advance ever made in the history of architecture. Only one would like to know the evidence for a fact the importance of which cannot be over-rated. The words of the writer of the Handbook and of the critic whom he quotes read like the talk of a man in his sleep letting out facts without knowing what he is saying. The complacent, half patronizing, half snubbing, tone taken towards the mighty organizer alike of the Roman Empire and of Roman architecture is charming beyond words. It is somewhat in the same spirit that the writer insists on giving the modern St. Peter's a precedence over the Mother and Head of all churches, which, when he does reach the patriarchal church, he is half obliged to retract. He assures us so often that the modern St. Peter's is "the most magnificent of Christian temples," that one half suspects that some vision of Durham, of Amiens, of St. Sophia, or of St. Paul's without the Walls, had arisen to make him a little doubtful of what he was saying. Then he goes on gravely to criticize the brutal desolation of the patriarchal church, and rules that the "medallions and stucco ornaments" "do not compensate for the disfigurement of the ancient edifice." All this kind of talk belongs to a past age in point of taste, just as it belongs to a past age in point of knowledge when we are told that Witiges "burned everything outside the walls." This doubtless comes from some Italian slanderer; it certainly does not come from Procopius, who bears witness to the respect which the Goths showed to the two great churches outside the walls, those of St. Peter and St. Paul. So again, Crescentius, in p. 430, is "barbarously put to death by Otto II. in 996, after his gallant defence of the castle of S. Angelo against that tyrant." Hard words certainly, even for the third Otto, still more so for the second, who, when Crescentius died, was already in the one Imperial tomb which Rome still shelters. The following sentence we have read over several times without catching a glimmering of its meaning. The writer has just been describing the Liberian basilica, the church of Santa Maria Maggiore on the Esquiline:—

In front of the basilica is one of the most beautiful Corinthian columns in Rome, called the *Colonna della Vergine*. It is of white marble, and is the only one which has been preserved to attest the magnificence of the basilica of Constantine, though it probably belonged to an edifice of an earlier period, possibly to the Temple of Peace founded by Vespasian.

As this comes in the middle of the ecclesiastical basilicas, any one would think that the writer was speaking of a church of Constantine's building, which, as the Liberian basilica was not built by Constantine, is a little puzzling. But what is meant really seems to be that this column was brought from the secular basilica of Constantine, or more truly of Maxentius, near the Forum; the new editor will do well to make this a little clearer.

On the whole, the Handbook, as we have it, represents creditable work a generation back, and, even in its present shape, it saves a great deal of trouble to those who know how to make use of it. But it is altogether behind the present state of knowledge, and it needs to be thoroughly recast before it can be really trustworthy. The only question is as to the process of recasting, which is a dangerous one. It is a mistake to believe that a weak or unintelligent account of anything can be made into a good account simply by correcting the positive mistakes. Every positive mistake may be got rid of, and yet the account may remain weak and unintelligent. It is so with a large part of this Handbook. What is wanted is not so much to recast the old Handbook as to make a new one, in the composition of which the writer will find the old one of very great use, and may often find it serve his purpose to incorporate large parts of it. But in any case the book must be at least recast, and recasting need not make the volume any larger. An intelligent account of a thing is, as a rule, shorter than a confused or blundering account, and room enough for the new discoveries may be found by the simple process of striking out the twaddle.

LIVINGSTONE'S LAST JOURNALS.*

IT is a fortunate circumstance, which could scarcely have been expected, that the record of Livingstone's last expeditions did not perish with him. The great traveller persistently made notes during his seven years of wandering, with the exception of one short period of distress and confusion. Besides the papers which were brought back by Mr. Stanley, the original note-books up till the time of his death were preserved and brought back by his faithful native servants. Mr. Waller has thus been able to put together a very complete history. He deserves great praise for the excellence of his editing, which has evidently been a labour of love. No editing, however, can possibly do for us what Livingstone could have done himself. At best we must be content with receiving the raw materials of a book of travels instead of the complete book. Many brief hints would have been expanded. A general description of the features of a district or the habits of a tribe would have summed up a series of detached remarks. And, in particular, we should have had a more complete statement of the principles by which Livingstone was guided in his explorations. It is of course not difficult to understand his general purpose; but here and there we should have been glad to know what were the precise considerations which determined the direction of his wanderings. The absence of such explanations helps to give a rather melancholy character to the book. Livingstone seems in it to be suffering under a kind of waking nightmare. The indomitable will is always present; but it is no longer able to overcome the oppressive weight of obstacles. As in a dream, the traveller is constantly struggling to move, and can yet make no continuous progress. And, as in a dream, he is surrounded by hideous scenes of grotesque cruelty which increase his misery, but leave him utterly powerless to interfere. His course seems to be directed by external fate rather than to conform to any wishes of his own. His frequent helplessness owing to the desertion of his servants and the bad faith of the Arab traders, his almost ceaseless sufferings from various forms of disease, his compulsory detentions for weeks and months in remote villages, are painful in the reading, though they increase our admiration of the dogged courage which bore him through them all.

A few dates may help to make the general outline of the story more intelligible. Livingstone left the coast on the 7th of April, 1866. Four months' travelling took him to the Lake Nyassa, the scene of some of his earlier explorations; he went round the south end of the lake; and the year 1867 was consumed in a long march through intricate mountain ranges to the south end of Tanganyika, and thence, nearly due west, to the Lake Moero, formed by the River Luapula, which he supposed to be the upper course of the Nile. After a long stay with a native chief near the shores of this lake, he struck southwards to the larger Lake Bangweolo, from which the Luapula issues. This was reached in the middle of 1868, and the remainder of that year and the beginning of 1869 were occupied in a return to Lake Tanganyika and Ujiji. In the autumn of 1869 he started again due east, into the hitherto unexplored Manyema country. Two years passed away in this region; till at last he retired exhausted and destitute to Ujiji, and there met Mr. Stanley in October 1871. With Mr. Stanley he visited the head of Tanganyika; and afterwards waited for supplies during a great part of 1872. In the autumn he started once more to the south to complete his exploration of the great Bangweolo lake, and, whilst passing round its southern shore, he fell ill, and died on May 1st, 1873. His followers completed the circuit of the lake, carrying his body with them, and, as we know, returned successfully to the coast.

Thus we have the history of seven most laborious years. Livingstone was borne up in his fatigues by the firm belief that he was solving the problem of ages, and discovering the head waters of the Nile. At one place he takes notice of the possibility that the Lualaba may be the Congo; but everywhere else he identifies it with the Nile without the slightest hesitation. Utilitarians may inquire whether it was worth while to sacrifice so many years of a noble life to the solution of this geographical puzzle. But with Livingstone the duty of unravelling the relations of this strange network of rivers had become a kind of ultimate postulate, which it would be cowardly even to question. "The prospect of death," he says in a passage of justifiable pride, "in pursuing what I knew to be right did not make me veer to one side or the other" in working out this task. There is a grandeur in such self-elevation irrespectively of the value of its end. It seems that in Livingstone's mind a kind of religious colouring was given to the sentiment by a theory which, we fear, will not receive much support. He had a notion that Moses had been in this part of Africa. "An eager desire," he says, "to discover any evidence of the great Moses having visited these parts bound me, spell-bound me, I may say; for if I could bring to light anything to confirm the sacred oracles, I should not grudge one whit all the labour expended." The sacred oracles, one would have thought, say nothing about Lake Bangweolo, but Livingstone had come to this odd conclusion by arguments which we need not examine. A more curious historical remark occurs in another place. In the neighbourhood of Lake Bangweolo, Livingstone met with a native who knew something of the older Portuguese explorers. "No trace," he adds, "seems to exist of Captain Singleton's march." This is not the first time that De Foe's hero has been quoted in serious books of African travel, but it is odd to find Livingstone

apparently speaking of his narrative as a genuine historical record. In spite of the editor's suggestion that De Foe may have had some real material before him, we should say that the remark seems to us to prove that Livingstone had not read what is a very palpable fiction.

Whatever Livingstone's grounds may have been for this firm conviction that he was on the Nile, there can be no doubt of the extraordinary heroism to which it stimulated him. So early as January 1867—that is, in the first year of his travels—he had a misfortune of which he speaks with an evident sense of its importance, and which, in fact, seems to have contributed more than anything else to the final result. A native guide deserted him, and carried off the medicine-chest. From this time, therefore, Livingstone was exposed to numerous attacks of fever without the all-important remedy. Bishop Mackenzie suffered a similar loss by the upsetting of a canoe. It is painfully clear that from this period Livingstone's powerful constitution began to give way. We have constant references to sickness and depression. "Every step I take," he says, some time after, "jars on the chest, and I am very weak; I can scarcely keep up the march, though formerly I was always first, and had to hold in my pace not to leave the people altogether." Soon afterwards he speaks of an attack in which for a time he lost consciousness, and remarks that it shows the power of fever without medicine. At the end of the year he is again complaining that he, who used to be first in the line of march, is now last; and rejoices that he did not go to the swamps of Lake Bangweolo, where the absence of medicine might have quite knocked him up. The words are ominous; for it cannot be doubted that when he at last started for that dreaded region his strength had been seriously undermined; and the hardships which he had to undergo might have killed a stronger man. The great feature of the dreary district in the neighbourhood of the lake seems to be the frequent bogs, which he calls by the expressive name "sponges." They are great collections of vegetable matter, soaked through and through with water. The weight of a traveller constantly breaks through the superficial covering into deeper holes; and incessant rains had made them more than usually troublesome on Livingstone's last journey. The intervening country was constantly flooded, and the traveller had to be carried on the back of his followers through streams often above the waist, and sometimes reaching to their lips. Constant attacks of dysentery were prostrating his remaining strength, and it is a consolation to read that, towards the end of this weary journey, he was gradually sinking into a torpor which made him unconscious of pain and danger. Under such circumstances we should not have been surprised if a much more querulous tone had been perceptible in his writings. And here and there, it is true, he makes a sharp remark about the "theoretical discoverers" who make maps of Central Africa in London, or the anthropologists who do injustice to his favourite tribes. Much more generally we have to admire the mixture of stoical courage and Christian resignation which keeps him to his task without unworthy murmuring. A man working so doggedly in spite of such grievous discouragements within and without may well be a little hard upon gentlemen sitting at their ease at home, and correcting his labours; though he is never so peevish as many of his fellows who had less excuse, whilst he frequently speaks with the warmest affection of personal friends and labourers in the cause of the negro. His dislike to the anthropologists is merely the reverse side of a most generous feeling. He is warm in his admiration of the unsophisticated native. Near the coast there is a more degraded race, and the extension of the slave-trade is gradually ruining the tribes of the interior. Livingstone frequently assures us that in physique and in the shape of their skulls they are at least the equals of the persons who deliver lectures about them in London institutions. We must confess, however, that it requires some charity to overlook some of their peculiarities. There seems to be no doubt of the existence of cannibalism among some of the tribes to the east of Lake Tanganyika; though we have the charitable suggestion that they were induced to indulge in human flesh by first beginning upon the "Soko"—a large animal of the chimpanzee or gorilla kind, which appears to be very good eating. Moreover they have a free and easy way of committing murders without provocation, and an absence of religious ideas which Livingstone has to admit with some reluctance. Whatever their moral shortcomings, it is plain that they are not likely to be improved by the presence of the slave-traders. There is a ghastly account of an apparently unprovoked massacre of women by Arab traders, at which Livingstone was present without the power to resist, and which fills him, as he says, with unspeakable horror. He says that he felt as if he were in hell, and adds, "I cannot stay here in agony." In fact, the scene caused his retreat to Ujiji, where he met Mr. Stanley. Other little incidents are significant in the same way—such, for example, as the song of the slaves, which Livingstone at first supposed to indicate their insensibility, but which, when translated, turned out to be an expression of their hope of coming back to haunt their oppressors after death. Indeed the constant sight of the horrors inflicted upon this wretched country by the slave-traders themselves, or by the wars which they encouraged or accidentally provoked, seems to have weighed heavily on Livingstone's spirits. The small native communities were everywhere in course of being ruined and broken up by the intrusion of the better armed Arabs, and a miserable scene of anarchy was the natural result. Livingstone found more consolation in observing natural history, as well as in working out his geogra-

* *The Last Journals of David Livingstone.* Edited by Horace Waller. London: John Murray. 1874.

phical results, and some of his remarks, especially upon the curious Sokol just mentioned, are pleasant in themselves, and form a relief to the general melancholy of the narrative.

On the whole the book can hardly be called other than a painful one, and yet it is worth while to receive the painful impression in order to appreciate the noble perseverance of one of the very first of all the heroes of travel. It is impossible to put it down without a new sense of the moral grandeur of Livingstone's character, even if his efforts seem to have been in some degree misdirected; nor should we close our account without saying a word of appreciation of the fidelity of the native servants who brought back the body and the papers of their master from the distant region in which he died. Five only of his original followers stuck to him throughout, and they deserve no stinted praise for their loyalty and intelligence.

EDGAR ALLAN POE.*

MR. INGRAM, the editor of a new edition of the works of Poe, has prefixed to the first volume a memoir in which he endeavours to vindicate Poe's memory from the charges generally received. The impression has hitherto been that Poe was a drunkard and a thorough-paced Bohemian. According to Mr. Ingram, the truth has been entirely distorted by Rufus Griswold, who has till now been Poe's only biographer. Griswold, indeed, is accused by Mr. Ingram, not merely of distorting facts, but of downright mendacity. We must confine ourselves here to recording our impression that Griswold certainly coloured his picture far too highly, either because he disliked Poe, or from a simple wish to make a sensation. Such conduct was certainly bad enough in a friend of Poe's, whether he did or did not tell wilful lies about his victim. In most cases there is no need to suppose anything more than a readiness to accept discreditable stories. In one case, however, Mr. Ingram, if we understand him rightly, charges Griswold with deliberately inserting certain personalities into an article composed by Poe, with the view of injuring his character. It is difficult to believe that any man can have been guilty of such an atrocity; and it strikes us as just possible that the passages quoted by Griswold did really occur in the article as written by Poe, and were suppressed by the editor of the magazine in which the article appeared. This, of course, is a mere guess; and, in truth, we have not sufficient evidence before us. But, in any case, Mr. Ingram seems to have proved satisfactorily that Griswold caricatured poor Poe, and that many of those best acquainted with the unfortunate man of genius really loved him, and have borne testimony to his amiable and honourable conduct in many relations of life.

On the other hand, we must say that the whole story of Poe's life becomes simply unintelligible if we are to take him to have been a man bound by the ordinary laws of responsibility. Like many other biographers, Mr. Ingram would make his hero virtuous at the cost of making him insipid. When we see a very popular writer appointed to edit a number of magazines in rapid succession, and always giving up every employment, and always in the depths of poverty, we suspect some cause for his misfortunes. Poe of course held that the world was in a conspiracy against him, being offended by his independence and plain speaking. A Mr. Graham, who knew him, attributes everything to the bad position of literary men in America, and to the fact that his writings appealed to a small audience. And yet we know that many American authors flourish very sufficiently, and if this biography be correct, Poe had the art of multiplying the circulation of every periodical with which he was connected. American publishers are averse enough to value such men, if they do not care for genius *per se*. We cannot doubt that so popular a writer might at least have made a decent living. The simple fact that Poe drank is admitted by Mr. Graham, who tries to make us overlook it by a quantity of irrelevant verbiage about "the passionate yearnings of his soul for the beautiful and the true"; and is just noticed by Mr. Ingram, who says that Burns, Goethe, and Byron behaved worse. Possibly; but what is that to the purpose? Would a biography of Burns, for example, omitting any reference to his dissipation, be tolerable or possible? When it is thought right to argue that Burns and Byron were humdrum respectable people, it may be right to tell Poe's life in the same way. Meanwhile we can pardon Mr. Ingram for his wrath against Griswold; but an impartial biographer will have to strike some kind of balance between Griswold and Mr. Ingram; though we fear that evidence of a trustworthy character must have become almost unattainable.

Mr. Ingram luckily indulges in very little literary criticism. We say "luckily" because that which he gives us is irritating from its commonplace character; and yet we may say a few words about it, inasmuch as Poe is not merely the subject of a good deal of this indiscriminating praise, but has been absurdly idolized by some writers who ought to know better. Poe's writings, beyond all doubt, have a true stamp of genius. They are strikingly original, and show a quality of mind almost as rare as that of some writers who deserve far higher praise. The *Raven*, in spite of its faults, has the merit of at once grasping the imagination. Once read it cannot be forgotten, and such stories as the *Murders in the Rue Morgue* show a capacity for ingenious construction unequalled by anybody who has not written in French. Poe's talent for clear logical statement would suggest that he ought to have been a man of science or a metaphysician, were it not that there is a certain

element of trick in everything that he writes. As Mr. Lowell says of him in the *Fable for Critics*, he is

Three parts of him genius and two parts sheer fudge.

The people however who, like Mr. Ingram, are content with heaping upon a popular writer all the usual commonplaces of adulation, cannot stop here. Mr. Ingram, for example, talks about Poe's "mastery over the mental strings and pulleys of our being." This has been said about every eminent writer from Chaucer to Dickens. Without asking what it precisely means—a question not quite so clear as appears at first sight—we should simply reply that Poe never described a human being at all. He can describe a ghoul, and he can describe an incarnation of ingenious reasoning; but true flesh and blood never appears in any one of his stories. Mr. Ingram refers, amongst other instances, to the *Murders in the Rue Morgue*. To say nothing of the trick, which is perhaps all the more clever because it is so obvious when once explained, by which just the necessary bits of evidence are manufactured, and the discovery of these bits afterwards represented as a marvel of penetration, there is not a single remark in the story which shows more knowledge of human nature than of the nature of ouran-outangs. The amateur detective finds a bit of hair, and, placing it under the microscope, sees that it is the hair of a particular ape. The stupidest of all real detectives, once provided with this piece of knowledge, would have drawn the same conclusion. Poe's extraordinary ingenuity is shown in his power of persuading us that such an inference is a wonderful proof of penetration; but it is an ingenuity more worthy of a mystifier than of a serious student of human nature. Or take the parallel story of the *Mystery of Marie Roget*. A great deal has been made of the fact that in this case a real mystery was described under fictitious names, and that Poe's conclusions were justified by the subsequent confession of the murderer. Now what was this extraordinary discovery? A young woman goes to an apparently disreputable house with a dark young man. She spends some hours there, and then goes with the same companion into a wood. She is never again seen alive, but her body is found in the river, and the dark young man disappears altogether. We will venture to say that, of ten commonplace detectives, nine would have guessed that the young man was the guilty person. There was not a tittle of evidence against anybody else; and if Poe had given his reasons simply and straightforwardly, it would have been a very ordinary piece of criminal inquiry. But Poe shows his singular dexterity by covering these obvious inferences with such a mass of ingenious remarks about logic in general, and so many elaborate refutations of silly newspaper guesses, that we fancy, so long as we abandon ourselves to his guidance, that he is miraculously acute. He is like a clever showman who takes us through a labyrinth, and carefully examines every false turn until we quite overlook the fact that, if we had been alone, we might have gone straight to the mark. As for knowledge of human nature, we can only discover such remarks as these; that blackguards at the present day generally carry pocket-handkerchiefs, and that a single man who has committed a murder is likely to be less cool in removing the traces of his crime than a gang of ruffians. The remarks are true enough, but they do not justify a critic in using language about Poe which would be suitable to Shakespeare. The most ingenious part of the whole article is the elaborate argument tending to show that certain scraps of clothing, found some time afterwards in a thicket, and supposed to identify the scene of the murder, were not really left there at the time, but placed there several days later. The intention is to infer that the murder took place in the house instead of the thicket, and therefore to criminate the keeper of the house. The argument is very clever, though the suggestion is not very remote; but it displays more knowledge of the mode in which a thorn tears a dress than of the "mental strings of our being." Our sense of Poe's literary skill is undoubtedly heightened when we observe how very commonplace the chain of reasoning becomes when stripped of its endless complications. Poe tells us that the real evidence will be drawn from the collateral events and "outskirts" of the tragedy, not from its central points; and yet his argument really depends entirely on the most straightforward bit of direct evidence. His skill in distracting us is remarkable; but when we examine what he has really done, our pleasure is damped by seeing how large a proportion of the effect depends on a mere trick.

When we turn to the stories in which Poe really deals with "the human heart," our admiration is qualified by something else, or, to speak plainly, by sheer disgust. Mr. Ingram tells us that Poe's writings really show a regard for the claims of conscience, in spite of what some critics have said, and he proves it by referring to such stories as *William Wilson*, where a man is haunted by a kind of double of himself, or an external embodiment of conscience. Certainly Poe finds the conscience useful when he can personify it as a mysterious monster. But it would be just as reasonable to say that the story of the *Fit and the Pendulum* showed that Poe was an ardent Roman Catholic because he gloats over the imaginary horrors of the Inquisition. People who like to describe the sensation of hanging or seeing a man hanged are not those who have the highest sense of justice or of the value of human life. It is not by such puerile tests that we are to judge of the morality of a man's writings. The question is rather, What passions does he delight to represent? Does he sympathize with pure affection, with high honour, and unshrinking heroism? Does he describe his villains charitably, and yet in such a way as to make

* *The Works of Edgar Allan Poe*. Edited by John H. Ingram. Edinburgh: Alexander Black. 1874.

his readers hate crime, whilst feeling merciful to criminals? Do his descriptions generally imply a soiled imagination, or one free from the grosser stains of sensuality? If we try Poe by such tests there can unfortunately be little doubt of the answer. There are some of his stories the power of which is proved by the fact that they leave a permanent stain on the imagination. One wants to wash oneself after reading them. To mention only one fact, a characteristic peculiarity of Poe is his absolute delight in describing a decayed human body. He feasts his imagination in the charnel-house. Mr. Ingram would probably consider the story called *Thou art the Man* as a proof of Poe's conscientious feeling. We can only say that when we first read it it turned our stomach, and that we heartily wish that we could forget it. This delight in the sickening and unnatural is Poe's most indisputable quality, though mixed with much that is admirable; and we want no further proof that his nature was grievously stained and morbid. We will only add that this tendency, which has recommended him to such writers as Baudelaire, is as bad in art as in morality. In all truly great and healthy art, the horror of the incidents is lost in the intellectual power and the grandeur of the sentiment which they evoke. Poe's weakness is decisively shown by the fact that we lose sight of the skill in sheer physical disgust. There are, to quote no other cases, two or three incidents in the story called *Arthur Gordon Pym* which are revolting examples of this attempt to impress by depicting, not the agony of a human soul, but the most loathsome objects. Between Poe and a really great writer, such as Hawthorne, there is the difference which may be found between two painters of a martyrdom, one of whom makes us forget the suffering in the rapture of the dying saint, whilst the other makes us forget the rapture in watching the hideous details of torn flesh and festering wounds. We fully admit Poe's singular skill as a manipulator of words; but the fact that such outrages upon all true feeling should be condoned by people who assume to be judges of art is a striking proof of the evil effects of literary dram-drinking.

HOPE'S WORSHIP IN THE CHURCH OF ENGLAND.*

IN this volume Mr. Beresford Hope has made a reasonable as well as valuable contribution to the literature of one of the "burning questions" of the day. He supplies ample materials for a much deeper and more satisfactory answer to the inquiry, "What is Ritualism?" than can be found, for example, in Mr. Gladstone's eloquent but superficial paper in the *Contemporary Review*. Indeed we believe that any one who will approach the discussion without prejudice will find in these pages all that is necessary to enable him to distinguish between the recent revival in the Church of England of such decency or splendour of worship as is fairly compatible with loyal acceptance of the Book of Common Prayer, and that morbid excess of ceremonial, or that unwise introduction of dubious innovations, to which the popular but inaccurate term Ritualism is properly confined. Few men have had better opportunities than Mr. Beresford Hope of mastering the subject. His public life has covered the larger part of the time during which the revival of spiritual life in the Church of England has been in progress. He has had no small share in the direction of the material development of architecture and the subsidiary arts in which that revival has found its outward expression. Himself an experienced church-builder and church-restorer, an active member of the Ecclesiological Society, an ex-President of the Institute of British Architects, and a copious independent writer on architectural, artistic, and ritual questions, he knows more than most men what the Church of England needed, and what she has achieved, in her waking up from the torpor and indifference of the Georgian age. And then again, as a member of the Royal Commission on Ritual, he has had personal knowledge of the views of all parties among us on the vexed rubrical questions which are at present in dispute. The opinions of so competent an authority would deserve under any circumstances very attentive consideration. Much more so when they are expressed with such conspicuous moderation and good temper as they are in the book before us. If this kindness of feeling, and fairness towards the opinions of adversaries, were more common among the disputants on both sides, the painful divisions in the Church of England which now threaten its very life would soon be healed.

We gather, from a careful consideration of Mr. Hope's whole argument, two general conclusions. The first is one which we should have been inclined to accept *à priori* without demonstration. It is this—that there is little real difficulty in drawing a practical distinction between those externals of worship, on the one hand, which are either expressly prescribed by, or are in doctrinal harmony with, the rubrics of the Prayer-Book as settled at its last revision in 1662, and such ceremonies of the unreformed Church, on the other hand, as were either expressly prohibited at the times of the Reformation, or are plainly inconsistent with the dogmatic standards of the revised Formularies. The great majority of the old High Church school of clergy and laity are loyally content with the former. A small minority of enthusiastic reformers are suspected, rightly or wrongly, of a wish to bring back the latter. A little tact and sympathy and forbearance on the part of their ecclesiastical superiors would probably have reduced the

mischievous done by the more extreme ceremonialists to a minimum. No considerable movement can go on without exceptional extravagance, which time would certainly abate and absorb. But when repression was attempted, it was done in such a spirit as seemed not only to threaten those congregations and their clergy who had never exceeded their legal privileges, but even to be hostile to that whole body of doctrine which gives its only value and significance to any ritual or ceremonial whatever. The result has been that this blunder—if indeed it be not something worse than a blunder—has thoroughly alarmed and disgusted the whole body of High Churchmen, and has driven them to make common cause with those more extreme, but not necessarily disloyal, however unwise, men whom they would otherwise have brought to reason. If this false step is to be retraced, it can only be done, we believe, by adopting the policy of allowing certain ceremonial matters to be regarded as open questions.

For this is the second conclusion which is forced upon us by Mr. Beresford Hope's survey of the whole history of public worship for the last three centuries; that in the ceremonial usages of a comprehensive religious body, such as an Established Church must be, a certain freedom and elasticity of practice must be permitted. It has never been so in theory, but it has always been so in fact. With characteristic inconsistency, English Parliaments have enacted successive Acts of Uniformity, which Englishmen have never cared to enforce with undue severity. A *modus vivendi* has always been discovered hitherto, by which the different schools of thought within the Church could manage in turn to assert themselves, and to contribute each its own share of energy and benefit to the body corporate, without needless and impolitic repression. If in future a rigid uniformity is to be enforced, one result at least is certain. The days of the Establishment, as such, will be numbered. It is quite impossible to read the history of the Prayer-Book, as Mr. Hope presents it to us, without seeing that in every successive change a certain compromise between opposite schools of thought was a matter of absolute necessity; and not only this, but also that certain questions, upon which no absolute decision could be reached from the even balance of parties, were left consciously and deliberately in suspense. No other view can explain the broad facts of the re-enactment, again and again, of the so-called *Ornaments Rubric*. Does any candid man suppose that an unqualified and perfect obedience was rendered to this rubric in any of its shapes by the whole body of the English clergy at any time since the second year of Edward VI.? No; it always represented, as it still represents, the theoretical standard of church worship, which was seldom or never reached in practice. Thus, at the last revision, its friends were strong enough to retain this rubric in its place, in spite of Puritanical opposition; but it may well be that they scarcely even wished, much less expected, that it would be enforced in their day. And, in like manner, its enemies were unable to exclude it, but may have taken comfort in the thought that it would continue to be a dead letter. Exactly the same conclusion would be reached now, as to the retention of this rubric, if the matter were put to the votes of the clergy—at least if we may judge from the reports given in the Church journals as to the decisions of the several diocesan Chapters throughout the country to which the question has been referred by the Bishops. Again, the retention of that other existing rubric prescribing the place for the Holy Table is an exactly similar case in the interests of the opposite school. The High Churchmen of 1662 were not strong enough to exclude this rubric from the revised book; a rubric which, nevertheless, a most insignificant fraction even of Low Churchmen—if any at all—ever thought of obeying. A great historic book, such as the Book of Common Prayer, can well afford however to show in its structure these "water-beaches," so to say—these deposits which attest the changes that it has undergone in successive ages. What ought to be the moral which wise rulers and legislators would draw from these considerations? Surely it would be the determination to accept the inevitable; to find out a *modus vivendi* for the present generation, and to hand on to other and better, or worse, times, as the case may be, the task of enforcing an iron uniformity of practice upon all, when at last a decisive majority shall have agreed in desiring it. In such a policy as this lies, we repeat, the only way of escape from present difficulties. It is notorious that the Church could not settle these questions, even if it were allowed to legislate for itself, by such a majority one way or the other as ought to be decisive. Nothing has more exasperated even moderate Churchmen than the recent systematic attempts to close some of these open questions, not by an appeal to the mind of the Church, however that mind is to be expressed, but by a series of judicial decisions on rubrics which are some of them confessedly ambiguous, and even contradictory. In the abeyance of the legislative power which would presumably rectify harsh or dubious expositions of the law, it is natural that judge-made law—stereotyping some enforced reconciliation of absolute contradictions—should command but little willing assent or respect. Men feel, in short, that the rubrics were made for the Church, and not the Church for the rubrics. These prosecutions have hitherto been directed exclusively against one party in the Church, which adds much to their hardship. Should a system of reprisals be undertaken—though we respect the self-command which has hindered the fratricidal retaliation—the result would be so unpalatable to both sides that a mutual separation would be inevitable. It is to be hoped then, in the interest of all parties, that questions which cannot be closed may be wisely left open.

* *Worship in the Church of England*. By A. J. B. Beresford Hope, M.P., Author of "The English Cathedral of the Nineteenth Century." London: John Murray. 1874.

This is, as it seems to us, the great practical conclusion at which Mr. Hope himself arrives. We have purposely not trench upon his arguments, for we wish our readers to make acquaintance for themselves with a volume which is so interesting in its matter and so attractive in its style that some, to our own knowledge, who have once taken it up have not laid it down till they had finished it. But we may be pardoned for describing briefly its general drift, and for insisting on some of the more salient points which it offers for remark. The writer begins with a succinct but graphic description of what the external worship of the Church of England was forty years ago compared with what it is now, even in its least ornate form, after the "uncontentious advance" which had been made among us before extreme ceremonialism made its unwelcome appearance. In this contrast he has been anticipated by the Archbishop of Canterbury himself, who, as if afraid of the probable consequences of his own disastrous Worship Regulation Bill, spoke very powerfully at a meeting of his Diocesan Church Building Society of the state of neglect both of churches and of services from which the Church has but just escaped. It is enough to condemn that measure to say that, had it been law in 1830, not one single improvement could have been effected in the externals of public worship. A predecessor of Archbishop Tait issued a formal Monition so late as 1851 against the most eminent theologian in his diocese for forming a voluntary surplised choir in his parish church. Of course this was a *brutum fulmen*. But had the Primato of that day been armed with the weapon which his successor has forged he would have won an easy victory, and choral services in parish churches would have been prohibited. This is but a single example of that attempted systematic repression of all zeal by the Anglican Episcopate which, had it been backed by legal powers, would have made any improvement of the fabrics or services of the Church of England simply impossible.

The several litigations on ceremonial subjects which have gone by appeal to the Judicial Committee of the Privy Council are successively described and analysed in this very complete handbook of the ritual controversy. We would call attention to the common sense which points out that, if the claim of the extreme Ritualists to bring back all usages that are not expressly prohibited is untenable, on the one hand, no less untenable and unworkable, on the other hand, is the dictum of the Judicial Committee that "no omission and no addition can be permitted." We next observe a real help to the understanding of that controverted expression in the Ornaments Rubric, "the authority of the Parliament in the second year of the reign of King Edward VI.," derived from the writer's own Parliamentary experience. It has been argued with some subtlety that, as the first Prayer-Book of Edward VI. did not come into legal use until Whitsun-day 1549, which was incontestably in the third regnal year of that sovereign, the rubric in question must really refer to ornaments that were in use before that book was legalized—namely, to such as were worn in the second year. But Mr. Hope shows conclusively that by Parliamentary usage the enactments of the Session of "the second and third of Edward VI." must be the authority of Parliament spoken of in the rubric, and that therefore in the rubrics of the first Prayer-Book is to be found the enumeration of the still legal ornaments of our churches and their ministers. This argument satisfactorily disposes of a somewhat embarrassing complication.

It is characteristic of the author of the *English Cathedral of the Nineteenth Century* that he finds in the principle of the necessary relation to each other of the acts of worship themselves as formulated in the Prayer Book, the rubrics which prescribe the external ceremonies accompanying and expressing those acts, and the constructional arrangement of the buildings in which those acts are to be performed, a clue to the real mind of the Church in its ceremonial practice. This is very ingeniously carried out in a detailed examination of the "chancels" which "are to remain as in times past," and in particular of the altar-tables, at which is celebrated that Sacrament of the Lord's Supper which Bishop Beveridge calls "the highest mystery in all our religion." Undoubtedly "the book, the rubric, and the building" must mutually affect each other. From this point Mr. Hope advances to a discussion as to the distinctive eucharistic dress, the right to which is claimed by those who believe that the Ornaments Rubric is still in legal force, although it has been practically in abeyance. It is perhaps a drawback to the permanent value of the present essay that so much attention is paid in this part to a recent memorial signed by certain clergymen against this distinctive dress and against the eastward position of the celebrant at Holy Communion. But the weak points of the petition are sufficiently well exposed, and a long quotation from John Evelyn on the sound and moderate doctrine of the Sacrament as held in his days, as in our days, by the High Church school in the Church of England, is so good in itself, and so seasonable for present controversies, that we can scarcely regret the discussion. Still more happy is the suggestion that there ought to be no invincible difficulty in framing an *eirenikon* in ritual which should satisfy both parties to the dispute. It is urged that, if the Dean of Chester and Dr. Liddon, representing the two extreme schools, could agree in the doctrinal definition adopted at that Bonn Conference which has been already described in our columns, it ought not to be impossible for them to agree in such ceremonial as should offend neither. The chief points under litigation and dispute are the following:—The position of the officiating clergyman at Holy Communion, and the distinctive dress to be worn at that service. Two other usages, of much interest, as being of the

highest antiquity and of accredited symbolism, and as free from any reasonable suspicion of superstition, are also strongly advocated by many. These are the use of lights, and of the mixture in the chalice. On all these matters Mr. Hope speaks very fully, discussing the present state of the law, as laid down in recent judgments, in its bearing upon each of them. We propose to recur, in a future paper, to some new and important arguments adduced by him which very materially affect the moral value of that judgment, in the undefended case of *Hibbert v. Purchas*, to which is due, undoubtedly, no small part of the present discontent and agitation in the Church.

CHRISTMAS BOOKS.

IV.

PICTURES of Italian Masters, Greater and Lesser. With an Introductory Essay, by William B. Scott. (Virtue and Co.)—Mr. Scott, as he tells us in the preface to his very interesting essay, has in his account of the Italian Masters passed over those with whom the general reader is already familiar, and has selected those whose lives and works are but "scantily known through English treatises and biographical books." He writes for the most part in a clear and lively style, though now and then we come upon a phrase which as much marks the decadence of English composition as the pictures of the later painters mark the decadence of Italian art. In one page we read that "Mengo was immensely influential," though perhaps we ought to feel grateful that he is not described as awfully or tremendously influential. In another page we are told that "every work of art may be easily relegated to its date and locality." In spite of these drawbacks, Mr. Scott has done his work well, and has added an interesting chapter to the popular history of art. The engravings, though we imagine scarcely fresh, do not fall short of the ordinary merit of such selections.

With this work we must class *Pictures by William Etty, R.A.* With Descriptions and Biographical Sketch of the Painter by Mr. Cosmo Monkhouse. (Virtue and Co.)—Mr. Monkhouse writes sensibly and clearly, and the engravings selected, though not all very interesting, are good illustrations of the artist's powers.

Welsh Scenery: chiefly in Snowdonia, by Elijah Walton, F.G.S. With descriptive text by T. G. Bonney, M.A., &c., Fellow and Tutor of St. John's College, Cambridge. (Thompson).—Mr. Walton's pictures, with all their merits, and they are not a few, most certainly do not recall to us any scenery that we have met with in this country. Perhaps he has painted so much among the Alps that he has acquired a kind of mannerism which he cannot lay aside among the Welsh mountains. Whether true to nature as seen in Wales or not, his pictures certainly have a prettiness of their own which wins for them a wide popularity. Were we so unfortunately situated as to have to make a present to a bride, we do not know that, outside of plate and jewelry, we could find anything that we should give with so much confidence as one of Mr. Elijah Walton's books of scenery.

Sunday Evening at Home: being Stories from History for Every Sunday, &c., in the Year (Advent to Ascension), by the Rev. H. C. Adams, M.A., Vicar of Dry Sandford. (Routledge).—What Mr. Adams means by "every Sunday, &c." we scarcely venture to conjecture. A celebrated letter was once dated Maundy Thursday. Perhaps Maundy Thursday is included in " &c." The design of his book is happier than the execution. He selects a story out of profane history which illustrates the moral duty that is enforced in the Epistle or the Gospel of the day. The stories may perhaps be found not uninteresting. The two we have looked at certainly fail in accuracy. In the story entitled "Wesley's Farewell to Oxford in 1744," Whitefield is clearly represented as having been at the University "some five-and-twenty years before." Now, Whitefield did not matriculate till the very end of 1732. Mr. Adams has an odd notion of the ordinary talk of the middle of last century. We find a baronet exclaiming, "Ha! what the mob like them not, then, any better than the magistrates? How do they show their dislike towards this Wesley, hey, Master Lee?" In the story of "The Last King of Athens" we have the dimensions of that city given in the eleventh century before Christ, while the myth of *Codrus* is not only told as if it were an undoubted fact, but it is also brought forward as "a proof that the Gentiles, through centuries of darkness and separation, still retained some knowledge of the true light that at the first had shone from Heaven."

We have to notice a republication in five volumes of Miss Alcott's *Stories* (Sampson Low and Co.) Her *Little Men* and *Little Women* have been so popular with little folk that we are not surprised to find them re-issued in a cheaper form.

Michael Angelo Buonarroti: the Story of his Life and Labours, by O. C. Black, M.A., Trin. Coll., Cambridge. (Macmillan).—The autotypes which adorn this handsome volume are both interesting in themselves and have moreover been produced with a great deal of skill. Mr. Black's narrative is instructive and readable. It would have been better, however, if it had been written in somewhat simpler English. In one passage we read how Filippo Lippi "could even cynically refuse to endue the convenient cloak of marriage, kindly proffered for his use by Pope Eugenius." In spite of this drawback the book deserves to take a high place among the works on art of the year.

The Holy Bible. The Handy-Volume Edition. (Bradbury, Agnew, and Co.)—The editor states in his preface that he believes

that "the opportunity is now for the first time given to possess the Holy Scriptures in a light and handy form, printed in a type large, clear, and easy to be read—capable of being used by the weakest without fatigue, by the aged with comfort." We cannot pretend to say whether this edition in all these good qualities has had no rival. It certainly deserves all the praise that the editor bestows upon it. We may add, too, that the references are unusually copious. The weakest part is the introduction to the various books, which had much better have been left out altogether.

L'Histoire de France; racontée à mes petits-enfants. Par M. Guizot. Tome quatrième. (Paris: Librairie Hachette).—We can do no more than notice the publication of the fourth volume of M. Guizot's History of France. We hope that some day it also will be published in a handy-volume edition. The grandchildren for whom it is written must have strong hands indeed if they can hold this heavy volume for many minutes together. Though we cannot here enter into any criticism of the merits of this interesting work, we can nevertheless express a strong hope that in the education of English children it will supplant many a foolish French book that is at present put into their hands.

The Vanity Fair Album, by Jehu Junior. Vol. VI. (Vanity Fair Office).—In the first five volumes of this Show of Sovereigns, Statesmen, Judges, and Men of the Day, nearly all the great folk have been exhibited. Though the net has had to be thrown more widely, and a shoal of the lesser fry caught, yet neither artist nor author shows any falling-off in cleverness.

Gath to the Cedars: Experiences of Travel in the Holy Land and Palmyra during 1872, by S. H. Kent. (Warne and Co.).—The narrative of these travels is pleasantly enough written and is fairly interesting. The traveller saw a good deal, and what she saw she has known how to describe. She does not in one or two places distinguish so carefully as she ought to have done between the facts of history and mere legends. She speaks positively of seeing the very window at Damascus from which St. Paul was let down, and the very spot on the causeway where he was converted. She seems also to find in the fact that Abraham's oak stands by itself a verification of "what is said to be the most exact Scriptural rendering of the passage—'the oak of Mamre.'" There is a very interesting photograph of the author taken standing by her horse in the midst of a group of Bedouins under the grand arch at Palmyra.

Goody Two Shoes' Picture Book, with twenty-four illustrations, and *The Marquis of Carabas' Picture Book*, with thirty-two illustrations, by Walter W. Crane. Printed in colours by Edmund Evans. (Routledge).—Mr. Walter Crane's illustrations are as amusing as ever. We would especially recommend to the notice of all infant schoolmistresses "The Absurd A.B.C.," which is given at the end of the second of the above books.

From Messrs. Marcus Ward and Co. we have received some very pretty cards for Christmas and New Year's Day. Among these the Old English Christmas Pictures by Mr. H. S. Marks, A.R.A., are unusually good.

A Rare and Choice Collection of Queens and Kings and Other Things. (Chatto and Windus).—We have not space to spare to give the full title of this strange medley of nonsense. It claims to be designed and written by S. A. the Princess Hesse Schwartzbourg, and it is "imprinted in gold and many colours by the Brothers Dalziel at their Camden Press." It is comical enough at the first reading, but, if we may venture to say it, its humour will not be found to wear well.

The Boy Slave in Bokhara, by David Ker, Author of "On the Road to Khiva." Illustrated. (King and Co.).—Mr. Ker in the preface to this story tells us that "he has attempted to convey genuine information in a more attractive form than that of a mere dry statistical report." The story will be found interesting enough, though it would have suited our taste better if there had been somewhat less of killing in it. We have unfortunately lost that hearty relish for violent deaths of all sorts which in our early years carried us through even one of Mr. Ainsworth's novels. The day once was when we should have admired the cunning art which closed a chapter thus:—"Ten minutes later, the officer came slowly back, wiping his sword on his horse's mane; and the desert vultures settled down upon nine carcasses which had once been the best soldiers of the Emir."

Lizzie Hepburn; or, Every Cloud has a Silver Lining. (Nelson and Sons).—We did not look very far into this story for the young. In the second chapter the heroine, an orphan girl nine or ten years old, comes across a young German who, finding that she is looking forward to meeting her dead mother in Heaven, says, "You are too old for such nonsense to be taught you any more. There is no such place as Heaven." The girl gets bewildered, and that night refused to say her prayers. "The first dark drop of unbelief had disturbed the placid waters of the child's mind." Quite as mischievous as the young German is the author who, in writing a book for children, would trouble their minds by letting them so much as know that there are those who deny the existence of a future state.

The Cartridges: a Suburban Story, by M. Bramston, Author of "Erick Thorburn." With original illustrations. (Warne and Co.).—Those who have had enough of striking adventures which never could have happened, and still more striking characters that never could have existed, will perhaps find in this quiet story of middle-class life a pleasant companion for a winter's evening. It is well written and some of the characters are cleverly drawn.

Elise's Expedition, by F. E. Weatherly, M.A. The illustrations

by H. Cross. (Warne and Co.).—*Alice in Wonderland* has seen a host of imitations, and this story is one of them. A young critic to whom we submitted this book remarked, "Alice is very good, and there might be two Alices, but after that you cannot put up with them."

The Ice-Maiden; and other Stories, by Hans Christian Andersen. Translated from the Danish by Mrs. Bushby. With drawings by Zwecker. New edition. (Griffith and Farran).—We are glad to see a fresh edition of one of the most pathetic of Hans Andersen's stories. Zwecker's illustrations are for the most part good, though he has failed, as well he might fail, to picture the strange kind of beauty which the writer has given to the Ice-Maiden.

The Works of William Shakespeare. Edited by Charles Knight. With three hundred and forty illustrations by Sir John Gilbert, A.R.A. (Routledge and Sons).—In this reprint of Knight's popular edition we have all the plays given us in two fair-sized volumes. The type is clear, and Sir John Gilbert's illustrations, though not new, are interesting.

Little Blue Eyes; and other Field and Flower Stories, by the Author of "My Young Days." With twelve illustrations. (Seeley, Jackson, and Halliday).—These stories are prettily enough written, and will be enjoyed by little children. The author would have done better, however, if she had been more careful always to keep on the level of her youthful reader's understanding. What meaning will a mere child get out of such a word as "ecstasy"? and why is Lamartine suddenly dragged into the story without even a line to tell the child who he is? The illustrations, we must not forget to add, are good.

The Life of an Elephant, by the Author of "The Life of a Bear." With twenty-four illustrations; and *Mrs. Mouser*, by the Author of "Aunt Annie's Stories." With twenty illustrations. (Both published by Seeley, Jackson, and Halliday).—These two stories are in the large clear type that a child delights in who has just learnt to read, but still reads with effort. The stories are fairly well written, interesting enough, as we have found by trying it, to win a child's attention and keep him from his play. The numerous illustrations add to the interest of the stories.

Though not printed in quite so large a type, yet much the same can be said of *Our Games: a Story for Children*, by Mary Hamilton, and *Katie Summers: a Little Tale for Little Readers*, by Mrs. Charles Hall. (Both published by Marcus Ward and Co.).

Little Wide-Awake: a Story Book for Little Children, by Mrs. Sule Barker. With nearly four hundred illustrations. (Routledge).—This book, with its gay outside, its abundant woodcuts, its stories, and its verses, would please the little ones, whether they had either just learnt to read to themselves or still knew of no other way into the letterpress of books than through the eyes of others.

The Story of a Summer Day, by the Author of "The Busy Bee." With twenty-four illustrations by E. Froment. (Seeley, Jackson, and Halliday).—Like one or two other of the books for children, this pretty story is so written and so printed that it will be within the grasp of a very young scholar. The Scotch phrases that now and then occur in it will, however, cause no small difficulty. It is a pity that the illustrations are so poor.

A Cruise in the "Acorn", by Alice Jerrold. With six illustrations in gold and colors (*sic*). (Marcus Ward and Co.).—We have here the interesting adventures of two children of twelve and nine years of age, who, having a father and mother unusually free from anxious thoughts, are allowed to go out boating alone. They get lost on an island, and their boat drifts away.

Messrs. De La Rue's Diaries come up to that high standard of general and astronomical excellence which they have so long maintained. Their *Desk Diary* especially deserves high praise, while their velvet-bound Pocket Book is all that the giver, if not that the receiver, of a present could desire.

Marcus Ward's *Indelible Concise Diary* is again published in the same convenient divisions to which we have more than once called attention.

GERMAN LITERATURE.

A COLLECTION of the correspondence of Ludwig Feuerbach*, published along with an imperfect biographical sketch and some fragmentary philosophical remains, contributes little to modify the picture presented by the even more imperfect memoir by Beyer, but much to complete and confirm it. Although but few of the letters, taken singly, are of any extraordinary interest, they collectively constitute a highly spirited and evidently accurate portrait of an exceedingly attractive character. The most conspicuous trait disclosed is perhaps the writer's transparent sincerity, a characteristic extending to the manner as well as the matter of his epistles. The utter absence of any attempt at writing for effect is richly compensated by his habit of only writing when there is something to say; while the pithiness thus imparted to his style tends to crystallize into little sparkling aphorisms. The tendency to employ concrete images as substitutes for abstract conceptions is very marked, and is indeed the outward and visible sign of the intellectual bent which led Feuerbach to make religion the spiritualization of human feeling, and to deduce all metaphysics from sensuous perceptions. His was manifestly a poetic and artistic nature, driven into philosophy by the want of an adequate gift

* Ludwig Feuerbach in seinem Briefwechsel und Nachlass, sowie in seiner philosophischen Charakterentwicklung. Von K. Grün. 2 Bde. Leipzig: Winter. London: Williams & Norgate.

of lyrical or pictorial expression, and the relentless blows which he subsequently dealt against metaphysics were in part the expression of his instinctive dissatisfaction. The first letters in the collection, addressed to his parents, vividly paint the first University experiences of the young student, his measureless contempt for Paulus, his enthusiasm for Daub, his resolution, to the consternation of his father, to devote himself to the study of philosophy. An unfortunate blank prevents our learning his impressions of Hegel, and we encounter nothing of special interest until we arrive at his simple and affectionate correspondence with his betrothed, previously to their establishment on the slenderest and most precarious income in the castle of Bruckberg. Some letters from Dr. Ruge afford a glimpse of the plans and wishes of the Radicals in philosophy and politics during the decade preceding 1848; but Feuerbach's own letters, which would have been far more interesting, are not published. Some letters to his wife give a lively picture of the philosopher's own attitude during the Revolution, and prove that he knew how to unite intense sympathies with democracy in the abstract with a sober and practical estimate of the actual situation. This was not generally understood, and he suffered much in popularity from the collapse of the extreme party by which his principles had been so noisily professed, and with which he was generally identified by public opinion. In defining "the Essence of Christianity" he had moreover defined his own limits as an independent thinker, and his later writings are little but repetitions of ideas already expressed. His last years, clouded by pecuniary troubles, and even privations, were nevertheless cheered by numerous tokens of sympathy. Some of the letters from admirers here printed are indeed ridiculous for their indiscriminate adulation and bigoted arrogance; but this cannot be said of the intellectual homage of Moleschott, or of the frank and artless sympathy of Konrad Deubler, a simple man of the people. The collection as a whole gives a most favourable impression of the sterling worth of Feuerbach's character, his intellectual honesty and fearless pursuit of truth, his entire disinterestedness in all transactions, his independence of popular approval, his patience and good humour under the most painful privations, the genuineness of his philanthropy, and the truly philosophic sobriety of his life. The literary remains now first printed contribute nothing to the illustration of Feuerbach's mental history, but occasionally express a striking thought with the aphoristic terseness characteristic of his style.

From one point of view Mlle. Assing's publication of her uncle's and aunt's love letters* may be regarded as her crowning indiscretion, inasmuch as she has never before published any correspondence so obviously designed to be strictly private, or emanating from persons whose wishes and feelings she was equally bound to respect. The impropriety, however, if not excused, is yet abated, by the fact of these letters being so very private that it is frequently anything but easy to understand what they are about. The editor has not vouchsafed a word of commentary, and without a commentary every second or third allusion is unintelligible. Nothing is perfectly clear save the uncomfortableableness of both parties, and not without reason. So far as we can make out, Varnhagen appears throughout the first half of the correspondence as attached to two ladies at once—the gifted Rahel, fourteen years older than himself, and a certain Fanny, inferior in mind, but, it may be assumed, superior in personal attractions. "I shall certainly," he *naively* says, "marry one or the other of you." Many a man in his situation has found at last that he could have neither; but Rahel, who indeed had no time to lose, seems to have urged on a decision which resulted in her favour. It was disinterested at any rate, for both lovers were in the narrowest circumstances, and Rahel represents her own family connexions in the most unfavourable light. These impediments, complicated with some strange unpleasantness in which that universal mischief-maker Clemens Boentano was concerned, delayed the fulfilment of the engagement for several years. The correspondence, beginning in 1808, terminates in 1813, leaving the lovers still in suspense. It is a doleful business altogether, and the reader has need to bear in mind the singular felicity of the union, when at last accomplished, not to find it utterly depressing. Neither are its melancholy and mystery relieved by any extraordinary energy of expression or liveliness of anecdote, though Rahel's thoughts are occasionally deep and true. There is a great dearth of notices of celebrated persons, and the absence, or at least the suppression, of patriotic feeling at so anxious a crisis in German history is very surprising.

"Pictures of Bolivian Civilization"† may appear somewhat of a misnomer, and the impression will not be removed upon more intimate acquaintance with the thing signified. Herr Mossbach, however, assures us that the disorders of Bolivian society are mostly on the surface, and that the interminable anarchy of the country is compatible with a reasonable amount of security for life and property, at least for foreigners. The people have fortunately no antipathy to foreigners as such, and if the latter avoid mixing themselves up in domestic broils, they may pursue their avocations in peace, subject only to a forced contribution now and then. The effect of these disturbances on industry may be fairly estimated from Mr. Mossbach's narrative, and although he has enough of venation to record, it certainly would appear that his complaints lie less against the soldiers than the lawyers. He was manager of

a copper mine, and the consequent confinement to one spot, as well as the loss of journals and sketches on his return home, excuses the almost total absence of information respecting the topography or natural history of the country. His pictures of its intestine commotions, on the other hand, are most graphic; we have skirmishes, battles, sieges, executions, adventures with marauding parties, and all other appropriate concomitants of continuous anarchy. Two successive Presidents are drawn to the life—Dr. Linares, pale, grave, anxious, wasted by the cares of precarious power; and the easy-tempered General Acha, kept against his will in the Presidential seat by an ambitious wife. On the whole, the prospects of the country do not seem encouraging. It turns in a vicious circle; the want of an outlet for its vast natural wealth diverts the energies of the people from industry to civil war; and civil war deters the foreign capital which would remove the obstructions to industry. Judging from Herr Mossbach's account, there is no lack of intelligence among the white inhabitants, and the patient, docile Indians would make an admirable peasantry. The mixed race, as usual, is the least promising, and unfortunately constitutes a large element in the population.

In an essay on "the Spontaneous Decomposition of Christianity and the Religion of the Future" E. von Hartmann* appears as an inquirer after a principle of intellectual unity adapted to supply the void which he assumes to be created by the decay of positive religion. The first part of the essay is purely negative, directed however, not against orthodox Christianity, but against the compromise attempted by liberal Protestantism. The critical merits of this school are fully admitted, but the author contends that the endeavour to restore a religious system to its original purity must necessarily result in its destruction, the pure original, when recovered, proving unsuited to the circumstances which have arisen in the interim. Materialism being equally unacceptable from the religious point of view, on account of its want of religious feeling, the author falls back upon Oriental Pantheism as a system capable of combining absolute freedom of research with devotional fervour. The merits and some of the defects of Brahminism and Buddhism are acutely pointed out, and, while too much wedded to the theory of his own great work to free himself verbally from the pessimism of these Indian systems, the writer makes concessions which are equivalent to a virtual retraction on several points. He has probably discovered that it is one thing to construct a cosmogony in theory, and another to make the actual world work tolerably in practice. Schopenhauer would have derided such an endeavour, and his disciple's attempting it proves that he no longer occupies the same ground. In modifying his views, however, he has lost nothing of his vigour and incisiveness, nor of that clear perception of external reality and of a pervading intelligence which distinguishes him so favourably from German idealists on the one hand and from materialists on the other.

Dr. Pfeiderer endeavours † to exhibit the process of decomposition at work in another class of ideas—those, namely, of the characteristically English school of philosophy as personified in Hobbes and Locke—which he represents as attaining their logical resolution in the scepticism of Hume. The leading purpose of his very candid and able work is to insist on the rehabilitation of the German school of idealistic philosophy, which he seems to consider a natural sequel to the triumphs of Sedan and Paris.

Dr. Dühring's ‡ philosophical system is announced as a new one; but, so far as the publication has yet proceeded, it is not easy to say wherein the novelty consists.

The idea of a general dictionary of self-taught geniuses is, so far as we know, original. There is something inviting about it, but the attempt to reduce it to practice results in the concoction of a most singular medley. The first part of Dr. Wittstock's Dictionary § on this principle brings together Æsop, Æschines, Astor, Audubon, Eugene Aram, and Pietro Aretino.

Another writer on education ||, taking Goethe for his text, endeavours to analyse the poet's character with especial reference to the influence of hereditary descent, both on the paternal and maternal side. Goethe has already done this himself in a well-known stanza, to which little can be added except in the way of confirmation and illustration. This Herr Hacker has done very agreeably.

A History of the Railway System of Prussia, by Landrath Schreiber ¶, is in a measure supplemented by a little work on the regulation of railway freights, by Councillor Jonas.** The writer recommends the English system of the establishment of maximum rates of transport.

A volume on the History of Primitive Mankind, by Dr. F. Ratzel ††, and another on the Constitution and Life of Plants, by

* *Die Selbstzersehung des Christenthums und die Religion der Zukunft*. Von E. von Hartmann. Berlin: Duncker. London: Asher & Co.

Dr. Thoms*, are favourable examples of the neat little scientific library, "The Fosses of Nature," of which they form a part.

The first volume of C. Wachsmuth's work on Ancient Athens† is devoted to the topography of the city, tracing the vicissitudes of its public edifices from the earliest ages to the period of Justinian. A second volume will treat of these buildings, with reference to the use to which they were applied, whether for official, sacred, or domestic purposes. The work is one of very great importance and value, testifying to a thorough acquaintance both with ancient authorities and modern topographers, and written in a simple and perspicuous style. A review of the labours of ancient and modern explorers is prefixed, as also a dissertation on the soil, climate, and physical configuration of Attica.

Another famous city of antiquity is the subject of a work by Dr. G. A. Zimmermann‡, who, under the guise of an account of Ephesus in the first century of the Christian era, has written almost a complete history of the city. His principal attention is naturally bestowed on the temple and the worship of Artemis, to which he ascribes a Semitic origin. There is also an interesting chapter on the commercial resources which contributed so materially to the splendour of the temple and its services, and consequently to the chief hold which Ephesus retains on the interest of modern days. Dr. Zimmermann himself treats the national creed in a narrow and puritanic spirit, and is quite incapable of entering into the feelings of a patriotic Ephesian.

It is much to say of any man that he has exhausted so extensive a subject as the history and bibliography of chess§; yet it is hard to believe that subsequent labourers in this field will find anything but gleanings after Dr. van der Linde. Every known work on the subject is most fully described in his volumes, which contain in addition upwards of five hundred diagrams chiefly derived from ancient works of extreme rarity; and he has only to acknowledge two limitations to his omniscience—the unhappy disappearance from the earth of F. Vicent's problems, printed at Valencia in 1495, and the impossibility of registering all the productions of a periodical literature which, in the shape of chess columns in the newspapers, already extends as far as Honolulu. The author's researches on the history of chess possess much interest even for general readers. At the expense of a prodigious number of myths, romances, and inaccurate reports, the first authentic notice of the game as we have it is pronounced to exist in the Arabian historian Masudi, in the first half of the tenth century. Its origin, however, was undoubtedly Indian, but Herr van der Linde considers that even this cannot be traced with certainty beyond about 800 A.D., and that it was not until its transplantation to Persia and Arabia that it emerged from the stage of the *chaturanga* or four-handed chess, in which the moves were partly determined by the cast of dice. From this time its progress was rapid, and Herr van der Linde's work contains a number of most interesting notices of the traces it has left in the chivalric literature of the middle ages. The Jewish literature of the subject is also a highly interesting section, specially contributed by the eminent Rabbinical authority, Dr. Steinschneider. The development of the powers of the queen and rook is the subject of an interesting investigation. Chessplayers, perhaps as a reaction from the patience they are compelled to exercise, have notoriously established a character for acrimonious pugnacity among themselves. Our author is no exception; he is perpetually assailing somebody or other, and his assaults admit of no quarter. He cannot endure to hear an antagonist out; his very quotations of unacceptable matter bludge with brackets enshrining little peppery notes of exclamation, or ejaculations of immeasurable disdain. One special object of his animosity is the late Professor Duncan Forbes, whom he accuses of having falsified the history of chess by palming off fictitious translations from the Oriental languages in order to conceal his ignorance of them. This serious charge demands an answer. He is also indignantly contemptuous of Philidor and his school, whom he treats much as Mr. Ruskin treats the representatives of the Renaissance. The Italian method of casting is another pet antipathy. These harmless infirmities of temper make the book almost as amusing as it is valuable, which is saying much. Not the least entertaining part of the work is the concluding section, devoted to such curiosities as chess in dream-books, in *tableaux vivants*, &c., and such derivatives from chess as the game of draughts.

The *Waltharius*|| is a romantic poem of the tenth century, composed in Latin on a Virgilian model, but animated by a truly Teutonic spirit. The authorship is ascribed to Ekkehard, Dean of St. Gall, assisted by a monk named Geradus. The German version, by J. V. Schöfel, the well-known humorous poet, is exceedingly spirited, and superior to the original, which appears to us to be too slightly rated by the editor, Herr Holder. The text and the translation are printed on opposite pages, with a valuable accompaniment of notes and illustrations.

After a thorough and very interesting examination of the various theories of the composition of the Nibelungenlied advanced since the time of Lachmann, Dr. H. Fischer* arrives at the following results. The Siegfried legend, originally a pure myth, was interwoven with the history of Attila and of Gunther, King of the Burgundians, about the middle of the fifth century, and received its final form about a century later. Much about this period it was adopted by the Norse Scalds. It first received a written form from Conrad, a scribe of Passau, towards the end of the tenth century. This version was in Latin, whether in prose or verse is uncertain. Some time in the twelfth century this composition formed the groundwork of a German epic, corresponding in essentials to the Nibelungenlied as we now have it. The author was an Austrian, who is to be identified with the author of the verses known as Kurenberg's Strophes. It is uncertain which member of the Kurenberg family he was; if Magene von Kurenberg, the date of the poem would be about 1130; if Conrad, about thirty years later. In either case it was twice subjected to revision towards the end of the century, and both versions are still extant. Originally composed for aristocratic circles, it was adopted by the people when French taste began to prevail at Court, and became a thoroughly national poem. These conclusions are in the main those of Pfeiffer, whose theory Dr. Fischer regards as thoroughly established.

Paul Lindau† is a smart writer, somewhat too conscious of his smartness. His collected essays are of some interest as demonstrating that liveliness is not unknown to German criticism; they were scarcely worth reproducing for their intrinsic merits. The most important, perhaps, is a very careful and appreciative review of Paul Heyse's *Kinder der Zeit*. Robert Hauserling's comedy, *Tend*, is treated with much severity. One of the most amusing of the minor essays is a satire on the German Universities' neglect of the living German language. A French student is supposed to arrive eager to penetrate the secret of the superiority of German intellectual culture; but to retire in dismay on discovering that, although he will find every facility for prosecuting the study of the Nibelungenlied, there is no provision for making him acquainted with Goethe, Schiller, or Lessing.

"Signets,"‡ by F. Künberger, is also a collection of reprints from periodicals, but mostly relating to political or ecclesiastical subjects. The writer, an Austrian journalist, wields a lively pen, and is successful in his sarcastic sallies against the Ultramontane party. The political articles are less satisfactory, their pungency not being tempered with any portion of the conciliatory spirit so essential in a State made up of diverse nationalities, the weakest of which is too strong to be ridden over roughshod.

The establishment of a German journal of high literary pretensions entirely devoted to the affairs of Italy§ is an undertaking which will enlist the sympathies of all who are interested in that country. Without disparagement to the rapid growth of literary taste and intelligence in Italy, it is nevertheless certain that she cannot as yet command either the mature erudition which Germany can contribute to the examination of her history, or the foreigner's dispassionateness of judgment on her internal affairs. Three of the most remarkable essays in the number, however, are by Italian writers. Signor Biondi institutes a comparison between the ecclesiastical legislation of Italy and of Germany, freely criticizing both, and arriving at the conclusion that the solution consists in handing over Church matters to the exclusive control of the laity. It may be questioned whether the patriotic laity in either country take sufficient interest in ecclesiastical affairs to give the experiment a chance. Signor Sommano investigates the *metayer* system of tenure in vogue in Tuscany, endeavouring to account for its exceptional success in that region; and Signor Fontanelli plunges into the mysteries of the Italian paper currency. There are also articles on the French invasion of Sicily in 1674-78, on some recently discovered particulars respecting Leonardo da Vinci, on the present political situation, and other topics. A most promising beginning has been made, and it is much to be hoped that the *Italia* will soon be able to exchange its present irregular publication for the status of an established periodical.

Social Pressure—Two Books on Political Economy—Landscapes, Churches, and Moralities—A Lost Chapter in the History of Mary Queen of Scots Recovered—A New Origin of the English—Linley Rochford—Palmer's Ovid—Christmas Books. III.—Minor Notices.

London: Published at 38 SOUTHAMPTON STREET, STRAND, W.C.

ADVERTISEMENTS.

SPURIOUS MODERN PICTURES.

ONE HUNDRED POUNDS REWARD.
Copies of the following Pictures have been recently sold at large prices as the Original Works of Mr. JOHN LINNELL, Senr.:

THE MOUNTAIN SHEPHERDS, size 30 by 24, date 1870.
THE TIMBER WAGON, " 30 by 24, " 1870.
THE PIPING SHEPHERD, " 30 by 24, " 1873.
THE FISHERMAN, " about 10 by 8, " 1873.

Mr. JOHN LINNELL has seen the above, and pronounced them to be spurious, and his signature forged on them.

Mr. EDWARD F. WHITE, who, as the chief purchaser and largest holder of Mr. LINNELL's later Works, is greatly interested in preserving their integrity, hereby offers a REWARD OF FIFTY POUNDS on his own part, and a FURTHER REWARD OF FIFTY POUNDS on the part of one of the Victims of these Frauds, payable on conviction of the party who forged Mr. LINNELL's signature on the Copies. The vendors are known. Information to be addressed to Mr. E. F. WHITE, Art Galleries, 13 King Street, St. James's.

DORÉ'S GREAT PICTURE OF "CHRIST LEAVING THE PRÆTORIUM," with "Dream of Pilate's Wife," "Night of the Crucifixion," "Soldiers of the Cross," "Christian Martyr," &c. DORÉ GALLERY, 35 New Bond Street, Ten to Six. Brilliantly lighted at dusk and on dull days. Admission, 1s.

ELIJAH WALTON'S PAINTINGS (Eastern, Alpine, Welsh, &c.) EXHIBITION, including Mr. Walton's Work during 1873 and 1874, now OPEN at Burlington Gallery, 191 Piccadilly. Ten till Dusk. Admission, with Catalogue, 1s.

WELSH SCENERY. By ELIJAH WALTON.—The Original Drawings of WELSH SCENERY, and a number of Alpine Drawings, are now added to the above Exhibition of Mr. Walton's Works.

FORTUNY.—The celebrated PICTURE of the CONNOISSEUR, by the late M. FORTUNY, is now on View at ARTHUR TOOTH'S Fine Art Gallery, 8 Haymarket, opposite Her Majesty's Theatre.

THE ARUNDEL SOCIETY'S FACSIMILES in COLOUR.
From the OLD MASTERS are Exhibited Free to the Public, Daily, and Sold from 10s. to 60s. each. Descriptive Lists sent, post free, on application to 24 Old Bond Street, London, W.

SCHOLARSHIPS.—AN ELECTION to FOUR ENTRANCE SCHOLARSHIPS, Two of £50 a year, One of £20, and One of £10, will be held on Wednesday, April 21, 1875. Apply to the BURSAR, Radley College, Abingdon.

MALVERN COLLEGE.

This College contains two Departments—the CLASSICAL and the MODERN. There is also a preparatory LOWER SCHOOL.

There are Boarding-Houses within the College Grounds, held by the Head-Master and others of his Staff; a Gymnasium, &c.

Board and Tuition under Fourteen, £80; over Fourteen, £90. Non-Boarders pay an extra Fee of £5. Special advantages for Sons of Clergymen and Home Boarders.

For further information, apply to the Rev. ARTHUR FARRER, M.A., Head-Master, late Fellow and Tutor of New College, Oxford.

The Examination for Scholarships and Exhibitions on December 22 and 23.

BRIGHTON COLLEGE.

Patrons.

The Lord Bishop of CHICHESTER.

The Duke of DEVONSHIRE.

The Lord LECONFIELD.

The Marquis of BRISTOL, &c.

President.—The Earl of CHICHESTER, Lord-Lieutenant of Sussex.

Principal.—The Rev. CHARLES BIGO, M.A., late Senior Student and Tutor of Christ Church, Oxford.

Brighton College offers a liberal education for the Sons of Noblemen and Gentlemen. The Classical Division is that usual in public schools, having in view the requirements of the Universities and of the learned professions.

The Modern Division has been organized with great care, and provides a thorough liberal and practical education for Boys intended for business or the active professions.

There is a good laboratory and a well-fitted carpenter's shop, both superintended by qualified instructors.

The College is situated in the healthiest part of Brighton, the school-rooms are large and well ventilated, and there is an excellent playground. The climate is peculiarly favourable to Boys of delicate constitution.

The College is endowed with fifteen Scholarships, some tenable during the Pupils' school career, others entitling the student to proceed to either of the Universities.

The NEXT TERM commences on January 19, 1875. Terms for Boarders 50 to 90 guineas per annum, according to age. The Sons of Clergymen, 50 to 70 guineas. For Non-boarders the fees are from £25 10s. to £31 10s. per annum.

For further particulars address the SECRETARY of the Brighton College, Brighton.

THE UNITED SERVICES PROPRIETARY COLLEGE, Limited, Westward Ho (on the N. Devon Coast).

Patrons.

His Grace the Duke of NORTHUMBERLAND, D.C.L.

His Grace the Duke of WELLINGTON, K.G.

The Most Hon. the Marquis of Tweeddale, K.T., G.C.B.

The Right Hon. the Earl of LAUDERDALE, G.C.B.

The Right Hon. Lord STRATHAIRN, G.C.B., G.C.S.I.

The Right Hon. Lord NAPLIER of MAGDALA, G.C.B., G.C.S.I.

And many distinguished Officers of both branches of the Service.

Chairman of Council—Major-General Sir H. C. B. DAUBENEY, K.C.B.

Head-Master—CORNELIUS PRICE, M.A., B.C.L. (late Master of the Modern Side, Haileybury College).

Second-Master—F. W. HASLAM, B.A. (First Class Classical Tripos, 1871).

The School opened with 60 Pupils on September 10; upwards of 60 additional names are entered for future terms.

A Senior Department is attached to the School for the preparation of Candidates for the various Military and Civil Services; Boys direct from a Public School, who can bring strong testimony to character, are admissible.

For further particulars address the SECRETARY of the HEAD-MASTER, Westward Ho, N. Devon.

NAVAL CADETSHIPS, &c.—"EASTMAN'S" R.N. ACADEMY, SOUTHSEA.

In November 1873, and November 1871, One-Third and One-Fourth respectively of the Successful Competitors for Naval Cadetships passed from "Eastman's." Pupils are received from Nine years of age and upwards.

CONTINENTAL.—Special Preparation for the ARMY, UNIVERSITIES, &c., Dinard, Brittany.—The ENGLISH CHAPLAIN, having very successfully prepared Candidates for the above, has now a few VACANCIES.—Address, Maison HENRI, Dinard (Hôtel de la Ville), France.

ARMY DIRECT, CONTROL, and WOOLWICH.—Rev. Dr. HUGHES, Wragg, Cam., who during the last Twenty Years has passed Three Hundred, has VACANCIES. Ample Assistance in Sciences, Classics, &c.—Castlebar Court, Ealing, W.

AN OLD RUGBEIAN, Cam bridge Classical Honour Man, who receives Two PUPILS, will have ONE VACANCY after Christmas. Terms, £200.—Address, VICKAR, care of Steel & Jones, Advertising Agents, Spring Gardens, S.W.

TO MILITIA OFFICERS and CANDIDATES for COMPETITIVE EXAMINATIONS.—Captain CHAWNER (late 7th Regiment) will have THREE VACANCIES after the December Examinations. Terms on application, and references.—The Manor House, Newton Valence, Alton, Hants.

OVERSLADE, near Rugby.—A first-class PREPARATORY SCHOOL, under the Rev. G. F. WRIGHT, M.A., late Fellow of Corp. Chr. Coll., Camb., and formerly Assistant-Master at Shrewsbury School and Wellington College.

DELICATE or BACKWARD BOYS.—A GRADUATE (Married) of Trin. Coll., Camb., an old Rugbeian, has TWO VACANCIES for his next Term. He offers Classes, French, and German.—A very superior home, and every care and comfort for delicate Boys; and if desired, Shooting, Fishing, and Hunting. Terms, 180 to 200 Guineas.—Address, Rev. H. K. L., Holdgate Rectory, Much Wenlock.

BRIGHTON.—Miss HANHART, successor to Miss BLUNDELL and Miss DUNING, will have, after Christmas, a few VACANCIES in her SCHOOL for YOUNG LADIES. Highest references.—Stratford House, Eaton Place, Brighton.

PREPARATORY SCHOOL.—Mrs. MITCHELL, Widow of the late Rev. Walter Mitchell, Vicar of Purton, Wilts, and formerly Vicar of St. Bartholomew's the Less, London, and Chaplain of St. Bartholomew's Hospital, receives a limited number of YOUNG GENTLEMEN, under Thirteen years of age, for preparation for the Public Schools. The Education is conducted by the Misses MITCHELL, with the assistance of Masters.

References kindly permitted to:—The Lord Bishop of GLoucester and BRISTOL, Lady PAGET, 11, Harwood Place, Hanover Square, W. Major PROWSE, Purton House, Wootton Bassett, Wilts. C. WYCKHAM MARTIN, Esq., The Hill, Purton, Wilts; and others. Address, Mrs. MITCHELL, 23 Belmont Park, Lee, Kent, S.E.

THE DAUGHTER of a DECEASED OFFICER is anxious to obtain a suitable SITUATION as MORNING GOVERNESS in LONDON. Is experienced. Teaches French (acquired in Paris), German, the rudiments of Latin, Drawing (simple and in crayons), Music, English Composition, and Literature. The highest references can be given.—Address, J. S., care of the Rev. S. M., Parsonage, Christ Church, Lower Sydenham.

A PHYSICIAN wishes to RECOMMEND the LADY who Educates his Niece.—She receives Twelve PUPILS, and has TWO VACANCIES after Christmas. Situation healthy, twenty miles from London. French and German Resident Governesses. Educational advantages great. First-rate London Masters. Home comforts and moral training exceptionally good.—For terms, &c., apply, to M.D., 25 Cavendish Square, London.

OVERLAND ROUTE and SUEZ CANAL.—Under Contract for the conveyance of the Mails to the Mediterranean, India, China, Japan, and Australia. The Peninsular and Oriental Steam Navigation Company despatch their Steamers from Southampton, via the Suez Canal, every Thursday, from Venice every Friday, and from Brindisi with the Overland Mails, every Monday.—Offices, 122 Leadenhall Street, E.C., and 20 Cockspur Street, S.W.

HYDROPATHY.—SUDBROOK PARK, Richmond Hill. Physician—Dr. EDWARD LANE, M.A., M.D., Edin.

For Invalids and those requiring rest and change. Turkish Baths on the premises.

BRIGHTON.—BEDFORD HOTEL.—Facing Sea and Esplanade. Near the West Pier. Central and quiet. Long established. Superior Rooms. Spacious Coffee-room for Ladies and Gentlemen. Sea-Water Service in the Garden. ROBERT PARK, Manager.

WINTER at the GRANVILLE.—Replete with Home comfort. Hydrotherapy, Turkish, Oregon, Balneo, Plunge, and Medical Baths. Billiard and Croquet Rooms; American Bowling Alley; beautiful Views, Sea and Shipping. Table d'hôte 6.30 P.M.—Address, THE MANAGER, St. Lawrence-on-Sea, Rammagat.

CHRISTMAS PRESENTS and NEW YEAR'S GIFTS.—WATCOMBE TERRA-COTTA ART MANUFACTURES. The Company have in stock at their Depot, 20 Oxford Street, W., Works of Art of great beauty, and many objects specially suitable for Presents.

Works: Watcombe, near Tisbury.

COUNT ARNIM'S TRIAL.

THE trial of Count ARNIM has ended in the condemnation of the accused, but only on a small and technical point, and to a very moderate punishment. There were three things with which he was charged. He was accused of not having restored soon enough one set of official papers, which he ultimately sent to the Foreign Office, of withholding papers belonging to the Foreign Office, which he owned he had in his possession, and of having carried off from Paris another set of papers, of which he would give no account. Further it was alleged that he withheld those which he owned to possessing, and had carried off those for which he would not account, for the improper purpose of gaining his own political ends by publishing them, or parts of them, when it might serve his purpose to do so. The Tribunal of the City of Berlin has held that on the last two heads of accusation, that of withholding papers acknowledged to be in his possession, and that of having carried off papers from Paris belonging to the Foreign Office, there was not evidence sufficient to sustain the criminal charge. The Court, in an elaborate judgment, traced the line between disciplinary and legal offences. Against discipline Count ARNIM had no doubt offended, but that was very different from his being legally guilty. The papers which he acknowledged to have, but which he refused to give up, were withheld by him on the ground that they belonged to him. The Court held that, if a diplomatic agent receives a despatch from the Foreign Office merely censuring him personally, the letter belongs to him. It is an admonition for his private guidance. If a despatch is sent giving instructions, but also containing censure, it will depend on the relative quantity of the two ingredients whether the document as a whole is to be considered one of instruction, and therefore public property, or one of censure, and therefore private property. The despatches which Count ARNIM claimed to retain were despatches partly of instruction and partly of rebuke, and although he might have been wrong in thinking that the quantity of rebuke preponderated, yet it was difficult to say that he did not make the mistake *bonâ fide*; and even if he may have afterwards seen that he was mistaken in his views, this could not be considered to have tainted the proceeding from the outset. As to the papers which he was said to have carried off from Paris, the Court held that there was no evidence to show that they were not still in Paris, or that, if they had been carried off, it was Count ARNIM who abstracted them. Nor was there any legal proof that Count ARNIM meant to make the improper use suggested of any documents he might hold. It was shown that he had on one occasion got a statement as to himself inserted in a Belgian paper, that he had negotiated for the purchase of a newspaper, and that he had probably had some communications with a Vienna editor; but what those communications were was not shown. A legal tribunal could not infer from these things that he had withheld or abstracted public documents with a view to publish them. There remained only the first head of accusation. When he left Paris, Count ARNIM took with him a series of despatches about ecclesiastical matters which he says he considered not suited for the perusal of his successor at the Embassy, who is a Catholic. He took these despatches with him to Berlin, and thence to Carlsbad. On being asked for them, he first said that he did not think he was bound to give them up; on the day or two afterwards he wrote to say that, if the

Foreign Office was of opinion that the despatches in question belonged to it, he would not dispute the views of the Foreign Office, but would restore them, and this accordingly he did. The Court held that he must have known that these despatches belonged to the Foreign Office, and that it was within his discretion to bring them to Berlin instead of leaving them at Paris, but that he could have no legal right to take them to Carlsbad. He had thus made himself guilty of the offence of removing public documents, and accordingly he was sentenced to three months' imprisonment, the imprisonment he has already undergone counting as one month of the term.

The judgment of the Court is not satisfactory to Count ARNIM and his friends, for the accused has been condemned on so very subsidiary and technical a point, and it seems so hard to say that what he did came within the terms of the law, that it is thought to be more than he deserves to have been held to have committed any legal crime at all. To Prince BISMARCK the judgment is also unsatisfactory, and it is easy to see why this should be so. Let us go back to the time when Count ARNIM was first arrested, and suppose that the charges on which he has been pronounced not guilty had never been made against him. What would Germany and Europe have thought if it had been announced that a person in the position of Count ARNIM had suddenly been arrested and imprisoned because he had brought some official papers from Paris to Berlin, and then gone off to Carlsbad and taken them with him, and on being asked for them by the Foreign Office had given them up four months before he was arrested? The judges say, that, without any bad motive being imputed to him, he was legally guilty of an offence in taking these papers out of Berlin. This is, we will suppose, right law, but who would ever dream of prosecuting an ex-Ambassador, and throwing him into prison, for carrying off papers which he had given back months before he was arrested? This was not the real reason why Count ARNIM was arrested; he was arrested because it was conceived that he was guilty of a criminal offence in keeping back the papers which he claimed as private, and it was assumed that he must have carried off certain documents from Paris, simply because they were not to be found in the repositories of the Paris Embassy. The Court has now decided that the grounds on which he was really arrested have not been substantiated. So far he was wrongly accused of a criminal offence, and though what remains may be enough for a court of law to condemn him, it is not nearly enough to justify criminal proceedings having been taken against him. Germans are excessively indignant if anything is said to cast a shadow of doubt on the conduct of their great man; but if there are any Germans who, after the decision of the Court, think that it was wise and just to arrest and imprison Count ARNIM, they have only to ask themselves whether they can really say that, if Count ARNIM had been accused of nothing else than carrying off some despatches to Carlsbad, which despatches he had restored in June to the Foreign Office, they would have thought it right and expedient to institute criminal proceedings against him on this head in October.

But it is quite possible that a course of action which in its direct aspect is indefensible, may indirectly and incidentally lead to good results. Count ARNIM ought not to have been arrested, imprisoned, and tried; but it may be at the same time admitted that very considerable benefits may accrue to Germany from his having been subjected to an injustice. In the first place, it must be very satisfactory to Germans to know that a German court of law has shown

itself independent in dealing with a political question, and that the tribunals may be relied on to take a legal view of points at law. To be sure that the judges are independent of the Executive is one of the pleasantest certainties which a nation can have, and very few nations enjoy it. In the next place, a very strong blow has been dealt by this trial to the treacherous practice which was creeping into modern diplomacy of officials publishing, in order to annoy their adversaries, documents which have become known to them in their official capacity. That Count ARNIM ever intended to make a dishonourable use of the documents he happened to hold is what no one ought to assert or to hint; but it is undeniable that not long ago there were rumours in quarters supposed to be favourable to him that he was going to do so, and those who invented or spread these rumours evidently thought that, if he did what they said he was going to do, he would be doing nothing extraordinary, and would be only employing a particular kind of weapon in his warfare with Prince BISMARCK. The ARNIM trial is eminently calculated to clear up such hazy views of what an ex-Ambassador may properly do. Then, again, it can hardly happen that the complete exposure of the long controversy between Prince BISMARCK and Count ARNIM should not suggest to Germans of all ranks that the positions which the disputants held towards each other was one in harmony perhaps with the old traditions of the Prussian monarchy, but very unsuited to the administration of the affairs of a great country at the present day. Count ARNIM and Prince BISMARCK were both servants of the EMPEROR, each on his own footing, and not the one the representative of the foreign policy of the other. Count ARNIM, when he was scolded and informed that his views on every subject of importance were shallow and foolish, instead of resigning, held on and offered more views of the same quality. Prince BISMARCK, instead of recalling Count ARNIM, scolded, taunted, and abused him. Prince BISMARCK could not recall Count ARNIM without pressing the EMPEROR harder than he cared to press him; and Count ARNIM felt that he could not be recalled easily, and thought that he too had friends at court. This is not the way in which a foreign policy can be carried on, and it is probable that such a thing will be made impossible for the future. The country and the EMPEROR will have learnt that the system which made Count ARNIM insubordinate will not do, and it will be silently and unostentatiously, but effectually, abandoned. Lastly, the ARNIM trial has had the great advantage for Germans that it has shown them what is the foreign policy which at a most important crisis has been pursued on their behalf, and what is the foreign policy which they have escaped having pursued on their behalf. If Prince BISMARCK had not been at the head of affairs, Count ARNIM would not improbably have been, and Germany will now know not only what Prince BISMARCK has done, but what he has averted. The foreign policy of the nation has been shown, so far as can be judged from the despatches published during the recent trial, to be in the hands of a man wise, moderate, far-seeing, and bold; and the happiness and prosperity of Germans are just now so bound up with the soundness of their foreign policy that they may rejoice to have come to know this, although they have come to know it rather unfairly, at the expense of Count ARNIM's personal liberty.

SIR WILLIAM HARCOURT AT OXFORD.

IF any of Sir WILLIAM HARCOURT's friends are guilty of the weakness of preferring his political interests to the public advantage, they may perhaps sometimes regret that his principles rendered it impossible for him to join the Conservative party. He could scarcely have failed, with or without an interval, to succeed Mr. DISRAELI as leader. He has the same enlightened freedom from Tory prejudices, the same contempt for popular crochets, and the same devotion to the Protestant element in the Established Church. His abilities and eloquence would have done credit to the Government, while, although they are not less valuable to the Liberal cause, it may be doubted whether the advanced section of the party will ever consent to be represented by Sir W. HARCOURT. His confession that he is a Whig or moderate Liberal will repel the sympathy of those who hold with Mr. STANSFELD that it is constantly necessary to devise new Liberal doctrines for the purpose of giving the party a reason for existence. After all, it is

possible that the old division of parties may become obsolete in political organization as it is in the opinions of intelligent Conservatives and Whigs. At a late meeting of Tiverton Mr. MASSEY, who a year or two ago inclined to extreme political views, manfully refused to sign the disestablishment of the Church or the extension of household suffrage to counties. If the unscathed declaration of Mr. GLADSTONE to certain B. G. E. leaders, some of his followers will find it necessary to their allegiance to less revolutionary leaders. B. G. E. leaders who carry out the revolutionary doctrine of the reasonable B. G. E. leaders.

Sir W. HARCOURT would be one of the ablest and most eloquent of its members. In his speech at Oxford he naturally professed to regard as a triumph of Liberal principles the adoption by the present Ministry of much of the policy of their predecessors. There is an obvious fallacy in the point which is often addressed to Conservative politicians that they never propose to repeal the measures passed by their opponents. Modern reforms have generally consisted in the destruction of institutions which, whether good or bad, cannot be restored to life. It would be absurd to attempt the reconstruction of the Irish Church, or to restore purchase in the army. As Sir W. HARCOURT acutely remarked, attacks on the administration of special departments naturally cease when the entities are transformed into responsible Ministers. The army and the navy were, he said, represented by the Conservative Opposition as utterly inefficient; but now nothing will be said against a system for which its former assailants have become responsible. It is not perhaps an unmixed public advantage that no party should be interested in detecting or exposing maladministration; but it is true that a certain time must elapse before Mr. GOSCHEN and Mr. CHILDESS can conveniently prove that Mr. WARD Hunt's fleet is a phantom. It would undoubtedly be difficult to discover any change in the foreign policy of England in consequence of one pacific Minister succeeding another, although Lord GRANVILLE had not of late yearned the opportunity of adopting an independent course which was seized by Lord DERBY in his refusal to take part, except through a mere delegate, in the Brussels Conference.

From the time of the general election which deprived him of office after a tenure of two or three months, Sir W. HARCOURT has exhibited a consistent and praiseworthy cheerfulness in the midst of his friends' misfortunes and his own. Any consolation which he may have needed may have been found in the consciousness that he had been the only politician who for two or three years before had distinctly foreseen and openly foretold the collapse of the Liberal party. He is still content that the Conservatives should have their turn of power, because, according to his theory, they continue a Liberal policy without sharing the errors to which they owe their own triumph. While he does justice to his opponents, Sir W. HARCOURT discusses the conduct and character of the leading members of his own party with a frankness which leaves nothing to be desired. He is apparently not of opinion that the nearest road to power is to be found in the advocacy of fantastic and subversive theories which he thought it unnecessary to specify in detail. It is indeed strange that a late Cabinet Minister should have devoted himself to the cause of the unchecked propagation of disease. The eagerness with which some Liberal politicians are seeking for means of recovering the popularity of their party almost justifies the contumelious overtures for co-operation which were made to them by Mr. CHAMBERLAIN in the *Portsmouth Review*. Sir W. HARCOURT, on the other hand, properly rejects the proposal that the moderate Liberals should desert all their principles for the purpose of entitling themselves to places in a future Radical Cabinet. It would perhaps have been well that, when he denounced an undue proneness to hazardous novelties, Sir W. HARCOURT should have kept clear of the difficult question of land tenure. His statistics on the subject appear to be vague, and his assumption that changes in the law of land would greatly increase the profits of cultivation is entirely conjectural. It is unreasonable to attribute the largeness of the sums which are paid for imported corn to defective cultivation at home. There would be no advantage in the free admission of foreign corn if English farmers could undersell their foreign competitors. It would be possible, and perhaps easy, to increase the gross produce of the land, but beyond a certain point artificial fertility

could only be produced at a loss. The serious objection to the use of rhetorical phrases in relation to land tenure is that subversive politicians are prepared to concentrate all their efforts on the spoliation of the landowners. Sir W. Harcourt's authority may perhaps be quoted for the proposition that the £20,000,000 are unnecessarily paid for foreign land, and that the charge that the actual distribution of the land is injurious to the public interest. It is each successive Crown grant, that some kind of legislation much more to the benefit of tenant-farmers. It is scarcely possible to alter, but the agitators are bent on compensation for disturbance as well as for unexhausted expenditure, and their success would involve an arbitrary transfer of a valuable property.

Having congratulated his adversaries and duly admonished his friends, Sir W. Harcourt proceeded to express his candid opinion of the leader of his party. His conventional statement that nothing in Mr. Gladstone's career justified the suspicion that he can have been guilty of the levity with which he has been recently charged was proper and decorous. Unluckily the general credence which has been given to a wholly unauthenticated rumour is entirely founded on the characteristic nature of the outburst which is recorded in the apocryphal story. If the anecdote had been told of any other eminent statesman it would have been at once rejected as incredible. The unknown author of the legend has given plausibility to his fiction by a close imitation of Mr. Gladstone's manner. While Sir W. Harcourt vindicates Mr. Gladstone from the imputation of reckless political versatility, he is not altogether blind to his possible errors of judgment. In his opinion, as in the opinion of the rest of the reasoning portion of mankind, it is not the business of a statesman to engage in theological controversy, nor to prove to some millions of his countrymen that they must either be inaccurate logicians or traitors. The illustration of a similar appeal which might be addressed to the Mahomedans of India is appropriate, and it has been used before. Many commentators on the Koran, if not the Prophet himself, held that it was a sacred duty to make war on infidels and to oppose their sovereignty. An appeal to them to abandon either Islam or their allegiance would not be a judicious measure. The only practical inference which can be drawn from Mr. Gladstone's pamphlet is that Catholic Emancipation ought to be rescinded unless the Decrees of the Council of the Vatican are rejected. The enormous circulation of Mr. Gladstone's pamphlet, exceeding that of the most amusing works of Dickens, is due to a strange misconception on the part of his ultra-Protestant admirers. The obscure style has perhaps prevented them from perceiving that the grievances which excite Mr. Gladstone's wrath are suffered, not by the co-religionists of Lord Shaftesbury, but by the followers of Dr. Dolling. Conscience that he has himself a better right than Mr. Gladstone to the character of a Protestant champion, Sir W. Harcourt is careful to explain that his efforts are strictly confined to the purification of the Established Church from Roman admixture. The Dissenters and the Roman Catholics may do as they please. Sir W. Harcourt is the stern guardian of the rubrics and of the Act of Uniformity. The latter half of his speech, which is exclusively concerned with ecclesiastical subjects, begins with a well-founded protest against the intrusion of politicians on theological ground. It is true that the Church may be regarded as having made a compact with the State; but it is generally inexpedient to attempt a strict enforcement of laws which are inseparably connected with doctrinal controversies. Mr. Gladstone tends to one extreme in theological opinion, and Sir W. Harcourt has no sympathy with his tendencies. It is impossible to discuss the difference between them except on theological principles; and politicians who are not excited by controversy will more and more lean to the system of comprehension which, as one of an unpopular minority, Mr. Gladstone naturally defended.

PRESIDENT GRANT'S MESSAGE.

THE audacious hoax which was perpetrated in the telegraphic report of the President's Message failed to produce the impression which might have been anticipated. The funds of Spain were not affected by menaces which, as it now appears, were never uttered. It was thought strange that an American President should, in

defiance of the so-called MONROE doctrine, invite the concurrence of European Powers in measures of intervention which might be adopted in Cuba; but no grave importance was attached to phrases which were borrowed by the writer from the habitual language used for many years in Presidential Messages. It was well known that, even if the President had cherished warlike designs, his policy would not have been supported by Congress or by the party to which he has hitherto belonged; and it seemed a far-fetched conjecture that he was bidding for re-election by courting the favour of the Democrats. In the genuine Message the President only mentions Cuba for the purpose of keeping alive the pretension of the United States to express an opinion on the insurrection. The admission that the internal disorders of Spain furnish an excuse for delay in pacifying Cuba renders the remainder of the President's remarks inoffensive. No Message has at any time contained scantier reference to foreign affairs. The United States have no dispute pending with any other Power, except that some delay has occurred in the payment of a debt due from the Republic of Venezuela. The President considerably observes that a rebellion is, as usual in South American Republics, proceeding in some part of the State. If at any future time internal peace should be consolidated, it is hoped that the consummation will be celebrated by a discharge of existing obligations. The President announces his intention of observing strict neutrality in the civil war on the Plata, which has since happily terminated, and in the possible war between China and Japan. He has received the balance of an indemnity due from Japan, and he recommends legislative measures to control the immigration of Chinese in the Pacific States of the Union. It is remarkable that the Message contains no reference to the Reciprocity Treaty with Canada which was supposed to have received favourable attention from the President and the SECRETARY OF STATE. It is possible that their approval may have been withdrawn in consequence of the declaration of the English Government that Canada will not be allowed to levy differential duties on English imports while American produce is admitted at lower rates.

The interest of the remainder of the Message is exclusively domestic, except that the President's theories on trade and navigation might, if they were embodied in legislation, affect foreign commerce. Since it is highly improbable that the present Congress will, during the brief residue of its term, pass any important measure, the President may be supposed only to have contemplated the object of recording his opinions on economical questions. He naturally says nothing of the Civil Rights Bill, which will be stopped by his veto if it should pass the House of Representatives and the Senate. His treatment of the question of Civil Service Reform, of which he is not supposed to be an enthusiastic supporter, is somewhat singular. The President thinks that, on the whole, the competitive mode of appointment is desirable; but he announces that, unless Congress passes some law to render it compulsory, he will abandon it altogether. A long time will probably elapse before American politicians consent to sacrifice the most efficient part of their machinery. It would be difficult to secure the zealous services of the managers of Conventions and similar bodies if there were no prize-money in the form of official appointments. The President has long inclined to the traditional mode of conducting political business, and he is not unwilling both to retain an ancient system and to devolve the responsibility on Congress. His apology for his action in Louisiana, and for his refusal to act in Arkansas, will be generally thought honest, and perhaps satisfactory. It was, he says, impossible to judge which set of candidates for office ought to have been returned in 1872; but KELLOGG's Government had existed for two years, and it had already been recognized at Washington. It could not be permitted to an armed body of citizens to depose the Government *de facto*; and the intervention of the United States' authorities was necessary for the preservation of peace. The term of office of the present Government is drawing to an end, and it is interesting to hear that the Judge of the Supreme Court who had made himself the tool of KELLOGG and his accomplices has resigned his office in fear of impeachment. In Arkansas the claims of the rival Governments depended on a difficult legal question, and the President's refusal to interfere was probably judicious. It is not surprising that the President should desire to be relieved from the necessity of interfering in State disputes.

In the whole area of twelve Southern States the numbers of the regular army amount to only 4,000 men. A force twenty times as large is habitually employed in providing for the safety of the city of Paris.

The essay on political economy and currency which forms the most laboured portion of the Message is only equalled in oddity of matter and of style, as a principal part of a formal State paper, by some of Mr. LINCOLN's cruder lucubrations. Former documents proceeding from the PRESIDENT have shown that during his tenure of office he has been an industrious student of commercial and fiscal theories. On one important point he has arrived at sound conclusions, which acquired practical importance when he interposed his veto on the plan for increasing the issue of paper money. As might have been expected, he adheres firmly to a decision which seems nevertheless to be partly founded on the most fanciful reasons. In the progress of his investigations General GRANT has not advanced beyond the stage of enlightenment in which it is supposed that the business of Governments and Legislatures is to stimulate with paternal solicitude the material welfare of the community. Taking for his text the depression and distress which have now existed for more than a year, the PRESIDENT commences his discourse by dealing with the supposed paradox that the elements of prosperity are abundant, although they fail to produce their natural result. Labour and capital have been plentiful and cheap, but it has been found impossible to obtain profitable employment for either. In the PRESIDENT's opinion the explanation of the mystery is in great measure to be found in the absence of a metallic currency. The encouragement of American shipping and the discovery of new markets for American produce must not be neglected; but Congress is in the first instance invited to adopt a currency "which has as its basis the labour necessary to 'produce it which will give it its value.' Not only gold, but the causes which are supposed to make gold valuable, approve themselves to the judgment of the PRESIDENT. "The debt and speculative classes" indeed may prefer a currency which fluctuates and sometimes expands, but, "admitting that these two classes of citizens are to be 'benefited by expansion, would it be honest to give it?' The 'debt class' would be still more directly benefited by absolute release from all liabilities.

The PRESIDENT is convinced that the people of the United States would reject a proposal of national bankruptcy and of universal repudiation of debts, and he contends that any expansion of the currency is subject to similar objections of principle. The simple-minded exposition of rudimentary propositions will perhaps fail to convince the supporters of inflation, but there may be reasons for expounding such doctrines in a President's Message which would scarcely occur to European statesmen. Hundreds or thousands of educated men could express the substance of the Message more elegantly, more clearly, and with fuller knowledge of the subject; but probably their arguments would never be read by those whom it is desirable to convince. A small portion of true doctrine may perhaps be more acceptable when it is imbedded in a mass of old-fashioned fallacies. General GRANT still believes that the sums paid to foreigners for freight represent a dead loss to the country, which he proposes to diminish by giving direct or indirect subsidies to American steam-vessels. The grants which would be necessary to effect his object would exactly coincide in amount with the difference of cheapness between English and American vessels. Whether it is for the interest of the American taxpayer to make good by his contributions the result of protective legislation in another department is a question for Congress and its constituents. A strong practical reason against adopting the PRESIDENT's recommendations will be found in his suggestion that new taxes will be required. It is much easier to apply a surplus revenue to wasteful purposes than to impose new burdens which may be easily shown to be unnecessary. There is no doubt that in all the opinions which he expresses the PRESIDENT is perfectly sincere. He shows good sense and good taste in abstaining from any notice of the revolution which has lately reversed the relative strength of parties. It is right that he should discharge his functions without reference to the political opinions which are respectively represented by the actual and the future Congress.

SIR STAFFORD NORTHCOTE AT EXETER.

SIR STAFFORD NORTHCOTE has been explaining to a Conservative gathering at Exeter his views of finance, and the special troubles he has in the discharge of his official duties. There is a very personal or peculiar in his revelations. His views of finance are those which every Chancellor of the Exchequer must hold, and his troubles are those which every Chancellor of the Exchequer must endure. The keeper of the national purse is bound to be a party to or to another, he would be equally ready to allow that fits of economy, followed by fits of recklessness, are bad things, that England must work hard to hold her own, that taxes must press on some one, and that the Ministry of the day should study the real wants of the people, and try to satisfy them. Every Chancellor in turn passes through the experience which has shown Sir STAFFORD NORTHCOTE that the head of the Exchequer must not admire anything, or he will be asked to pay for what he admires, nor be afraid of anything, or he will be asked to pay for precautions against that which he fears, and that one good plan at least is to seem a little stupid, and vow that he cannot quite make out what those who ask him for something really mean. Good finance consists in getting money well and in spending money wisely, and to raise the nation's income fairly and without doing avoidable mischief, and to lay it out so as to get the best possible return for what is spent, is the double duty of the Chancellor of the Exchequer. The first is much the pleasantest sphere of operations. Every now and then the adjustment of taxation affords brilliant openings to financial genius. It is possible every now and then for men like Sir ROBERT PEEL or Mr. GLADSTONE to give a fresh opening to national enterprise by infusing new ideas into the general scheme of taxation. Such an opportunity Mr. GLADSTONE believed he had found at the beginning of this year; but the Conservatives of Exeter aided in forcing Mr. GLADSTONE to keep the secret of his financial reformation to himself, and in returning a Parliament which preferred the unambitious Budget of Sir STAFFORD NORTHCOTE. It is not, however, either incumbent on a Minister or good for a nation that great schemes of financial readjustment should be always forthcoming. If the general plan of English taxation is right—and statesmen of all parties agree that it is substantially right—the Budget of the year may be a very good Budget although the changes it introduces are unimportant. Unless he has fallen upon evil days, and has to invent new taxes to make up a deficit, the shaping of his Budget is the most entertaining part of the Chancellor's work. He must indeed be prepared to disappoint some people who had hoped that they were going to receive a special benefit. But it is not very difficult to keep them quiet, as so many other people are glad that they should be disappointed. The patient way in which the farmers year after year believe Conservatives out of office who promise to get the Malt-tax repealed, and instantly acquiesce in the necessity of a Conservative Ministry keeping the Malt-tax unrepealed, must be very encouraging to all Chancellors of the Exchequer, and to Sir STAFFORD NORTHCOTE in particular. And when a Chancellor of the Exchequer is dealing with the general scheme of taxation, he has the satisfaction of having to do with big figures, vast interests, and great results. He has an opportunity of showing what is in him, and if he succeeds his success is apparent to all the world, and gains him general credit and admiration.

It is far otherwise when he comes to discharge the other half of his duty, and to limit expenditure. He has then to baffle, to worry, and to alienate individuals. He raises hosts of silent enemies, while the good he does passes almost unnoticed. In the first place, he has to see that no more new money goes out than is amply warranted. When he has to propose an increase of expenditure on some broad principle and for some indisputably national end, his task is not very difficult. Englishmen, for example, are not so stupid as not to be able to see that, if they wish to have a satisfactory army and yet to avoid conscription, they must offer those who voluntarily enlist terms good enough to obtain an adequate supply of efficient recruits. It is the enthusiasts, the alarmists, the projectors of ingenious schemes, the representatives of special interests, who are really hard to manage. They cannot have the money they want. They must be denied, and the only question is how to deny them so as to give them nothing

and yet not make them very angry. Mr. Lowe thought the best way of managing was to dismiss them with a few epigrammatic sentences showing conclusively what idiots they were. Sir STAFFORD NORTHCOTE has observed that Mr. Lowe's way was not altogether successful, so he has not on a way of his own. When a deputation irritates or humiliates him more than he can stand, he professes to become friendly, and to fail to understand what is said. This is a safe answer, and we hope it will, for it is an art which each successive Chancellor might hope to acquire without much difficulty. But it seems scarcely wise in Sir STAFFORD NORTHCOTE to have told his secret so openly. It is to be feared that when during the next Session a deputation waits on him, and finds it is not making much way, its members will whisper to each other, "Sir STAFFORD is shamming dull," and will take their departure in wrath. However, deputations which come to propose something that cannot be entertained for a moment must be got rid of somehow, and probably most men would prefer being deadened by a look of blank and unmeaning obtuseness in the face of their auditor to being made the victims of a shower of brilliant repartees. It is when those who come to ask for money have a real claim to be heard that the true difficulty of the Chancellor of the Exchequer begins—when an object is pointed out which it seems right for the Government to take up, or a demand is made the fairness of which it is hard to dispute. In such a case Sir STAFFORD NORTHCOTE could not in justice to himself affect to be devoid of intellect. He would have to understand, and to show that he understood; and if he had made up his mind to a refusal, he would have to admit that he had only a limited amount of money to spend, and that the Government he represented could not afford to be just to every one.

It is not, however, even in giving discouraging answers to applicants who deserve encouragement that the most arduous part of the duties of the Chancellor of the Exchequer really lies. Those who want new money, who have never had what they say they ought to have, can be put off tolerably well with the hope that their turn must come, and that they are sure of getting what is owed to them sooner or later, although they may have to wait. It is very different when the Chancellor proposes to take away what is in the possession of those whom he considers himself bound to attack. Retrenchment, cutting down salaries, abolishing sinecures, forbidding men to hope any more for that which they believe they have been led fairly to expect, these are the things which seriously test the courage and the patriotism of a Finance Minister. Sir STAFFORD NORTHCOTE said at Exeter that he was sure there was much waste and mismanagement in many branches of the public expenditure, and that great economies might be effected if the nation would but set to work earnestly, and would exercise the same wholesome supervision over its establishment which a prudent and active householder exercises over his. If Sir STAFFORD NORTHCOTE sees this as clearly as he says he sees it, it becomes a part of his duty to apply the necessary remedies to the evil he deplures. But these remedies are very painful remedies. They cause much irritation and suffering. They give persons and whole classes of persons distinct and tangible grievances. No one minds as long as general language is used, and nothing is done. But directly any specific instance of waste is alleged, and particular people are threatened, there arises a chorus of indignation. The Ministry that intervenes to check waste is immediately set down as a harassing Ministry. The GLADSTONE Ministry honestly set itself to check waste, and got thoroughly hated for its pains. It is true that it went about its work in an unnecessarily rough way; that it employed such instruments in its labours of reform as Mr. AYTON, who displayed great zeal and resolution, but who often exhausted himself in trying to save the wrong halfpence, and who treated every recipient of public money as a beggar would treat a pauper infant. But the GLADSTONE Ministry did not merely err in the manner in which it discharged its duties; it also gave great offence by believing it had duties to discharge. It made enemies of all who preferred to be left alone in their accustomed comfort; and one of the attractions of a Conservative Government was that it was thought sure to abstain from meddling. If Sir STAFFORD NORTHCOTE means to make his words good, if he was not using vague language so as to gain credit for vigilance while he had made up his mind to overlook everything, he will have a bad time before him. He will earn the approval of his own

conscience, and will raise his own reputation, but he will incur much unpopularity, and disappoint many who thought that they might rely on the masterly inactivity of a Conservative Government. He is not likely to commit precisely the same faults as his predecessors. He will not reproduce the jocose severity of Mr. LOWE or the parochial harshness of Mr. AYTON. He will do disagreeable things as pleasantly as he knows how to do them. But disagreeable things are disagreeable, and we hope, rather than expect, that he will dare to do disagreeable things, and that he will really exercise the supervision of a resolute householder over the national expenditure.

THE UNION OF THE CENTRES.

THE Centres in the French Assembly seem equally impatient of union and of separation. One proposal after another designed to enable them to act together is rejected as impracticable, and each is immediately followed by another aiming at the same end. While they are debating upon a common policy they are most impressed by the number and hopelessness of their differences, but as soon as they have decided to remain apart they are equally impressed with their inability to effect anything except in concert. The Left Centre has lately decided that it will not take into consideration any isolated constitutional law. This determination is fatal to the proposal of the Right Centre and of the Committee of Thirty to place the Bill for creating a Second Chamber in the orders of the day immediately after the new year. The Legitimists will not vote for any constitutional law whatever. The Left will not vote for the creation of a Second Chamber unless it is presented as part of a complete Republican Constitution. The Bonapartists denounce it as veiling an Orleansist conspiracy. There is no chance, therefore, for this Bill with few friends unless the Left Centre can be induced to support it. Of course the Left Centre have very good reasons to give for their refusal. They have come to two conclusions regarding the condition and wants of the country. France needs, they think, a settled Government, and the only possible settled Government is the Republic. Neither of these requirements would be satisfied by the gift of a Second Chamber. The Government would be no more Republican, and consequently no more settled, with a Senate as well as an Assembly sitting at Versailles, than it is with an Assembly sitting there without a Senate. The Right Centre urge that true political wisdom consists in taking what is to be got at any given time, and they accuse the Left Centre of forgetting the proverb about half a loaf. The Left Centre deny that the proverb is applicable. What the Right Centre offer them is not half a loaf, but something which is not even made of bread. They ask for a Republic, and the Right Centre propose to give them a Senate. Now a Senate may be an element, perhaps a useful element, in a Republican Constitution, but it is in no sense the equivalent of a Republican Constitution, and the Left Centre are not disposed to accept anything short of such an equivalent.

As soon as the Centres had parted company upon this point, the search for a ground of common action was, as usual, begun over again. This time the suggestion has come from the side of the Left Centre, and it has, for a wonder, been received favourably by the Right Centre. It is not as yet clear, however, how far the Left Centre concur in it as a body. The author of the proposal is an anonymous correspondent of the *Journal des Débats*, but the *Journal des Débats* has given it importance by making it its own. According to this plan the Left Centre may consent to pass the Bill creating a Second Chamber, provided that the Right Centre will consent to the insertion of a clause postponing its operation until such time as the other constitutional laws have been passed. The Left Centre have hitherto refused to have anything to do with a Senate unless it comes to them as part of a Republic. They are now asked to waive their objection on the understanding that the Senate, though constituted on paper at once, shall not be constituted in fact until the Republic, or some substitute for the Republic, shall have been established. A proposal of this kind may easily call forth very various criticisms. Against it there is the obvious fact that it is merely an evasion of a difficulty. The opposition between the two Centres rests on the fact that one of them wants the Republic while the other wants the Monarchy. There can be no real alliance between them until such time as

one or other of them consents to give way, and any scheme for uniting them which does not go upon this principle only postpones the inevitable separation. Supposing the Left Centre consent to pass the Bill with the proviso suggested by the *Journal des Débats*, what will they have gained? The controversy between them and the Right Centre has reference, not to the propriety of establishing a Second Chamber—upon this both Centres are agreed—but to the propriety of establishing the Republic. So long as this remains unsettled, no agreement upon minor points will be of any avail. Indeed the Left Centre may easily lose by consenting to this compromise. There is now a certain amount of sympathy between them and the Left. If the Left came to suspect the Left Centre of a disposition to sacrifice the Republic to an imaginary union among Conservatives, this sympathy would be at an end. Would not their consenting to discuss a single constitutional law apart from the rest—and that law the least Republican of all—be taken as sufficient evidence of such a disposition? And if it would, the whole fabric of Conservative Republicanism which has been built up with so much labour by the Left Centre would come to the ground. On the other hand, there is the chance that the Right Centre, if they can but be kept in association with the Left Centre, may by degrees learn to look at the situation with more practical eyes. They are in some respects in a more promising condition as regards this change than they have ever been before. They are not now led astray by any delusions upon the subject of their numerical strength in the Assembly. They know that the majority of the Twenty-fourth of May can never be recalled to life. They know that no form of Government other than the Republic can possibly be set up in France so long as the dividing lines between the various parties run as they do. If they could once be led to pursue a common policy with the Left Centre, even upon a question of little moment, they might in time get a habit of looking at affairs in the same light which might influence their action in questions of real importance. The Left, it is true, may feel some contempt for the long-suffering of the Left Centre, but it will be a contempt which is very likely to be qualified by the consciousness of how necessary to the establishment of the Republic the co-operation of the Right Centre is, and by the consequent admission that any concession which postpones the day when the Right Centre have finally to determine whether this co-operation shall be given or withheld deserves at least to be favourably construed.

Even M. GAMBETTA has come forward to do his part towards removing the obstacles which part the Centres from one another. There is something terrible to the imagination of a French Conservative in having any share in founding a Government which is favoured by the Executive. M. GAMBETTA probably sees that this feeling operates injuriously on the prospects of the Republic, and he takes the opportunity of meeting the *Times*' Correspondent in his walk from the Versailles station to the Assembly to protest that he is not so black as his enemies paint him. He is not in the least desirous of driving Marshal MACMARTIN from office; on the contrary, he will recognize him as President until the close of the seven years for which he has been appointed, and if he finds the nation or the Assembly willing to re-elect him at the end of that period, M. GAMBETTA will offer no objection. In this respect, as he takes care to point out, he is much more the friend of the MARSHAL than M. THIERS is. Nor is it only a President that M. GAMBETTA is willing to receive at the hands of the Conservatives; he will accept a Constitution also. If they will honestly undertake to frame a Republic, they may frame it after their own mind. M. GAMBETTA's object is to see the Republic recognized as the legal Government of France; and if the Conservatives will meet him on this platform, he promises on his side to meet them in a thoroughly conciliatory spirit. They shall have the first innings; they shall administer the Republic for the next six years of its existence; and not until those six years have come to an end will M. GAMBETTA ask the country to decide whether his theory of the Republic or theirs is the best calculated to ensure good government. If the Right Centre are well advised, this remarkable statement will go a long way towards quieting the terrors with which they view the advent of the Republic. Unfortunately this very week has supplied an instance of their inability to understand their own interest which goes far to invalidate their claims to even the

smallest portion of political vision. The Bill for abolishing the monopoly of the State in the matter of the higher education has been opposed by many members of the Left on the ground that it will benefit the Roman Catholic Church and no one else. Men like M. LABOULAYE have protested against the narrowness of this objection, and, for once, the Conservatives in the Assembly have seemed to have the advantage in point of liberality over the Left. An amendment was brought forward on Tuesday which goes a long way towards making the Bill do in form what the Radicals accuse it of doing in substance. It was proposed that the right of opening establishments of superior instruction should not be conceded to less than three persons, the intention obviously being to give an advantage to religious congregations. The whole Right supported the amendment, and it was made an instruction to the Committee which has charge of the Bill. The advantage which the Right have hitherto enjoyed of being associated with Liberals like M. LABOULAYE in the demand for freedom to teach has thus been thrown away. They can no longer accuse the Radicals of caring only for liberty when it happens to answer their own purposes, when, by the vote of Tuesday, they have laid themselves open to the same charge. It is by follies such as these that one French party after another succeeds in making its friends despair of it.

THE METROPOLITAN BOARD OF WORKS.

THE Metropolitan Board of Works, in publishing its annual Budget, regards with not unnatural complacency its powers, its revenues, and its achievements. The Board was created for the best possible reason, because there was a great work to be done which could only be accomplished by a central authority. It would have been impossible to construct the great drainage system of London if the engineer had been subject to the control of a score of Vestries. The rate which provided the necessary funds might perhaps have been levied in the form of a contribution from the various parishes and districts; but it was also necessary to borrow large sums of money on the credit of the rate; and capitalists would not have been satisfied with a security of a complicated and troublesome nature. In constituting the Board Parliament judiciously tried an experiment which was in England comparatively novel. It seemed probable that the nominees of elected Vestries would be among the most competent of their members; and while it was necessary to make a taxing body representative, it seemed desirable to avoid the uncertainties of popular choice. Although conventional objections are frequently raised to the alleged anomaly of indirect or secondary election, there is no reason to complain of the manner in which the Board has discharged its duties. On its first establishment it had the good judgment and good fortune to select an engineer of the highest ability; and Sir JOHN THWAITES, the first Chairman, was an industrious and useful man of business. It was highly proper that, while the other members of the Board discharge their duties gratuitously, the Chairman, who is practically responsible for efficient administration, should receive a salary which is certainly not excessive in amount. Elective bodies, large and small, can only exercise their executive powers through their officers; and it is for this reason that in the Netherlands, and in some other Republics, the principal person in the State has been the secretary or clerk of the sovereign Assembly. In a Board which exercises only a limited municipal authority there is no risk of the usurpations which may have been apprehended in Republics; and consequently it is convenient that the nominal and real executive power should be combined in the same person. No contrivance will prevent the concentration of municipal or of political power in the hands of a few persons; and the advocates of popular election, or of any other kind of nomination, only differ as to the mode of choosing a Government. It is perhaps not a bad plan to appoint the officers who are sometimes described as *Ediles* by a triple election, in which the ratepayers elect the Vestries, which appoint the members of the Metropolitan Board, who finally choose their own Chairman. Sir JAMES HOGG has devoted himself with laudable assiduity to the duties of his office, and his immediate constituents deserve credit for not insisting that the incumbent of the highest office in their body should belong to the class of tradesmen.

The Board which was found competent to direct the great scheme of the main drainage was fitly rewarded by the gradual enlargement of its functions. It has now the chief control of streets, and in the prosecution of various improvements it has arrived at the dignity of a large public debt, which holds a good position in the market. The revenue and the regular expenditure for which the Board provides amount to about 380,000*l.* a year; and the sums which are raised on capital account for various purposes of improvement sometimes reach a larger amount. No great city has in modern times profited more largely than London by the public works which have been constructed. The rebuilding of a large part of Paris under the Empire was less useful than the main drainage of London, and the Thames Embankment has substituted the most ornamental thoroughfare in the metropolis for an accumulated mass of deformities.

It is natural that success should encourage ambition; and the Metropolitan Board is now bent on acquiring some powers which are not even possessed by completely organized municipal bodies. The Board has formerly often come into collision with the City Corporation; but both bodies have lately formed a kind of alliance which may be called exclusively offensive. Both the Corporation and the Metropolitan Board have deposited Bills for taking compulsory possession of the property of the Gas Companies; or, as an alternative, for establishing works of their own, which would combine the creation of much unnecessary nuisance with the most wasteful expenditure of public money. The construction of new gas-works in districts which are at present free from the inconvenience would be but a small part of the annoyance which the ostensible scheme of the Board would produce. It would be intolerable that new mains should be laid in every street by the side of the existing means of distribution. The promoters probably trust to another among the two or three strings of their bow. There are also Bills for giving the governing bodies additional powers of interference with the Companies, if Parliament is unwilling either to permit a mischievous competition, or for the first time to take the property of the shareholders by compulsion. It is hard on the Companies whose affairs have been fully considered by Parliament within five or six years that they should be now compelled to defend their property against opponents who dispose without control of large public funds. It has been often admitted that the best way of terminating a chronic agitation is to provide on fair terms for the sale of the undertakings; but if the transfer is effected against the will of the Companies, Parliament will have created a precedent which every Committee on the subject has deliberately refused to establish. The Board of Works lately intimated a disposition to negotiate for a purchase on the basis of the average price of shares for the last three years. During the whole of that time the high price of coal has rendered the maintenance of the usual dividends doubtful; and during a part of the time which would be included in the calculation the agitation has been one of the elements for the consideration of purchasers. It is in the highest degree inequitable that the value of a property which is to be taken by compulsion should be damaged by intending purchasers with the effect of reducing the market price. The effect of incessant menaces is proved by the fact that London gas shares may be bought to pay about 6 per cent. on the purchase money. In provincial towns where, as in London, the income is tolerably permanent, the return on a purchase is seldom more than 4½ per cent.

While it might be for the comfort, though not for the profit, of shareholders to part with their property for its fair value, the communities respectively represented by the Corporation and Board of Works would find that they were for the present neither better nor worse for the transfer, though they might hope for some future advantage. The consumers are already entitled to the benefit of an increase of revenue; and perhaps they may think that their residuary interests would be more vigilantly guarded by municipal bodies than by the Companies. After the transfer, as before, they must pay the cost of the gas which they use; nor could they obtain a better quality than that of the present supply, except by increased expenditure. The Board of Works would use the same establishments, they would probably contract with the same coalowners, nor would they enjoy any advantages in arranging the price which are not open to the Companies. The same engineers and other officers, or successors of no higher professional standing, would perform their present duties neither more nor less efficiently

than when they served the Companies. There is no trace of evidence that Corporations have supplied gas or water more cheaply or more satisfactorily than Companies. In all matters of this kind the work is done by persons of special attainments, who are wholly indifferent to the nature of the bodies which they serve. Skilled workmen of all ranks, from civil engineers and analysts to artisans, work after their own fashion, whoever may be their employers. It may perhaps be worth the while both of the Corporation and of the Board of Works to consider the possible indirect results of their own aggressive proceedings. The Corporation has a right to its vast property, for the simple reason that it is the owner; and Parliament has not up to this time opened up the large question whether the estates of Corporations and private persons might be diverted to more beneficial purposes. The gas shareholders also own their property, and some of them depend on it for subsistence. Compulsory purchase at an inadequate price might establish a precedent especially dangerous to the City. The Board of Works, if it has no estates to lose, may remember that its own existence is not secure. Mr. BRAI's unwise project of civic revolution has apparently been exploded, notwithstanding the chorus of newspaper applause with which it was at first received; but more plausible substitutes may be devised for the Metropolitan Board, which is really less popular than it in some respects deserves. It is not unlikely that the ratepayers may regard with less confidence than the Board its future powers of dealing with the price and quality of gas. If the transfer is authorized, the debt must be increased by several millions; and although it may be presumed that the interest will be covered by the gas receipts, it may possibly become sometimes necessary to lower the quality. The promoters have more than once suggested that, if the Board of Works undertook the supply, the establishment of a minimum illuminating power, the official inspection, and the other restrictions to which the Companies are subject, would become superfluous.

PROGRESS OF INDIA.

IN noticing Mr. MARKHAM's statement of the progress of India during the year 1871-72, we described it as a "model Blue-book." Its author has not allowed the success of his first effort to make him careless about future improvements. There were shortcomings and omissions, it appears, in the statement for 1871-72 which unfitted it to be, as had been intended, the first of a yearly series. This place is now assigned to the statement for the year 1872-73. The contents of the former volume are incorporated into the new one, with the statistics brought down to the later date, and with many additions and improvements introduced under their proper headings. Thus the section on Land Revenue now contains a full account of all the minor settlements, as well as of the Permanent Settlement in Bengal. The section on Trade and Manufactures has been completely re-written. And a new section has been added, giving a short account of the rulers and of treaty rights and obligations of each native State. This part of the statement is admirably calculated to impress English readers with the enormous extent and variety of our Indian dominions. No less than four hundred and sixty native States acknowledge the supremacy of the British Government. With some this bare acknowledgment is all that is yielded. Others have pledged themselves to follow the advice of the VICEROY. Others pay tribute or maintain a military contingent at their own cost. Nor is this condition of things likely soon to pass away. The sovereigns of nearly all these States have since the mutiny been allowed to secure themselves against failure of heirs by the exercise of the right of adoption; so that, unless forfeiture is inflicted by way of punishment for rebellion against the paramount State, the area of the dominions directly administered by the Government of India is not likely to increase.

The two matters in this volume to which Englishmen will turn with most interest are Trade and Manufactures and Emigration. The dependence of a large part of the population of India on the produce of a rude though not inefficient husbandry, and the formidable numbers of the classes which are thus supported, have been brought home to us by the recent famine. The failure of a single crop threw nearly all the inhabitants of the distressed districts upon the charity of the Government. The judicious extension of irrigation and of communications between different dis-

tricts may go far to prevent the recurrence of similar disasters; but the inevitable pauperism of a dense population, whose increase is subject to no restraints except those which have been removed by the paternal care of the Government, is a scarcely less formidable danger. If the people of Bengal cannot find new means of supporting themselves, or be induced to emigrate, large numbers of them must starve or be maintained at the expense of the State. The problem which English statesmen had to face forty years ago will confront Indian statesmen in far larger proportions. Emigration from Bengal has unfortunately been discredited by the abuses with which it has been mixed up. The growth of the tea-plantations in Assam created a demand for additional labour in that district as long ago as 1858; but, in spite of a regulating Act passed in 1862, the condition of the emigrants was one of virtual slavery. The mortality among the labourers in the contractors' depôts and on the voyage was excessive. It is calculated that in the three years from 1863 to 1866 more than thirty-one thousand coolies must have died out of about eighty-four thousand exported from Bengal. This extraordinary death-rate was principally due to diseases caused by want of food; and the tale was made up out of the runaways, who were caught and flogged in a way that left them but a small chance of life. Since 1868 there has been a great improvement in this respect. There are now nearly forty-five thousand coolies working under contract in the tea districts, and the deaths during 1872-73 amounted to 1,504. Many labourers remain after their contracts have run out, and strict rules are enforced as regards the provision of food, lodging, and medical attendance. Emigration to countries not subject to the Government of India is now regulated by a consolidating Act of 1871. The enlistment of the emigrants is placed under very strict regulations which are enforced by agents and protectors appointed by the Government of India or by the local Government in each Presidency. The vessels conveying them are licensed and carefully surveyed, and British agents are appointed in the countries to which the emigrants are shipped under regulations passed by the Governments in the case of British colonies, and under conventions in the case of foreign Governments. The business of these agents is to see that the contracts made with the emigrants are not departed from, that the work given them is not excessive, that they receive the wages and rations agreed upon, and that the means of returning to India are provided at the expiration of the term of service. In 1872-73 the number of emigrants was 17,171. It will be seen that coolie emigration aims at supplying labour to other countries rather than at removing the surplus population from India. To what extent it will answer this latter purpose also must depend in a great measure upon the inducements held out to the emigrants to outstay the period of their contracts.

The most promising industry of India is the cotton manufacture. How vast a field lies open to it if it should prove capable of occupying it may be inferred from the fact that in 1872-73 14,545,772l. worth of cotton piece goods were imported into India. By degrees, however, native industry is catching up Manchester, and the manufacturers of the latter city have helped on the change by sending out inferior goods. It is not wonderful that local cotton mills should have "almost annihilated" the English trade in grey shirtings when seventy-five per cent. of the cloths exported from England were rendered worthless by the employment of deleterious compounds in their preparation in order to increase the weight of the goods. Within the last ten years steam spinning and weaving mills have been introduced into the Bombay Presidency, and the eighteen mills now at work give employment to 10,000 hands. Much of the cloth manufactured in these mills is dyed and printed in the neighbourhood. There are many cotton manufactories in the Punjab. In Mysore cotton cloths are woven in nearly every district, and in Madras a considerable local export trade has arisen in piece goods and twists.

The cultivation of cotton is increasing in extent, and the quality of the crop is also improving. In the Dharwar district the introduction of American cotton has been a complete success. The number of acres under cultivation in 1872-73 was greater by 336,000 than in the preceding years. In Sind there is every prospect of a valuable crop being obtained by crossing the American cotton with the Dharwar native. It is also probable that by careful selection and cultivation the native cotton may be greatly improved.

As regards the latter point, more might have been effected if somewhat less had been attempted. It is of little use to set even the best-trained English farmer to teach the ryots until the teacher has first observed their modes of farming, and learnt from them all that they have to teach him. Until English agriculturists have as exact a knowledge as the natives of the soil, climate, and plants of the country, the natives will beat them. At least this is the opinion of Sir GEORGE CAMPBELL and of Mr. HALSEY, the Acting-Commissioner of Cotton and Commerce. It is when the European cultivator knows all that the native knows that he will be likely to see the way to knowing more, but not till then.

Mr. MARKHAM makes a remark with regard to the action of European taste upon Indian workmen which is full of ill omen to another important industry, the woollen manufacture. "The commencement," he says, "of European influence of the best kind on Indian manufactures is beginning to be clearly perceptible." We have not been fortunate enough to see any examples of what the natives of India can do under European influence of the best kind, but we have seen something of what they are capable of under European influence of the worst kind. Dealers in Indian carpets say that there is a great and increasing difficulty in obtaining them in the old colours and in the old patterns, and that when a workman attempts to copy European examples his eye loses all that sense of colour and grace which gives to Indian fabrics their characteristic merit. How subtle the action of this influence must be is proved by the fact that the carpets made in gaols are almost worthless from the impossibility of making the prisoners reproduce under supervision the designs which in their own huts they followed without trouble and without teaching. The best service that European influence can render to Indian art is to let it alone. It is not worth while to lose all that is distinctive in Oriental workmanship for the sake of getting a poor reproduction of inferior French taste.

CHARITABLE APPEALS.

IT cannot be denied that a good deal of nonsense and sham sentiment has come to be mixed up with the idea of Christmas; but there is happily one custom of the season which shows no symptom of adulteration or decay. The appeals to the benevolent which just now occupy so much space in the newspapers represent a very healthy and honourable feature of English character. There is no other country in the world in which so much lavish charity is constantly bestowed; and during the present week there must have been great numbers of people who felt their money burning in their pockets until they had devoted some of it to the relief of the sick and miserable. It can hardly be doubted that the instinct which prompts this liberality is sound and wholesome, for it represents that tenderness and sympathetic feeling which keeps fresh the heart of a nation. At the same time it must be admitted that through carelessness and thoughtlessness the liberality is frequently misapplied. It is notorious that a large part of the pauperism of London and other large towns has been fostered by mistaken kindness, and by that sort of easy giving which is too often rather a salve to the giver's own feelings than a studied benefit to the recipient. To a reflecting mind there is perhaps nothing so hard and pitiful in life as the difficulty of trying to do good without harm coming of it. Almost every avenue of philanthropy is thus beset with doubts and difficulties. Alms to the casual beggar may make him a confirmed pauper; help to the struggling labourer tends to weaken his sense of independence and reliance on his own efforts; the pursuit of charity becomes a trade, and the agencies of its distribution a profession; and what between the money which is lost on its way to the poor and that which reaches them only to corrupt and demoralize them, the charitable are certainly exposed to sad discouragements. Still, good must be done sometimes, and in any case, after making full allowance for the evils of careless and indiscriminate relief, it may be believed that it is better than none at all. There can be no doubt, however, that it is the duty of all who can afford to give to make their contributions as useful as possible by taking the trouble to consider how they are likely to operate, and in what way they can be most effectively applied. The familiar saying that he gives twice who gives without delay may be still more strongly applied to the case of the man who thinks twice before he gives, so that he may be sure

that his money will not be thrown away. It is a pity that when there is so much generous liberality, a little more discrimination in its application is not added to enhance its value.

We have more than once pointed out the very strong objections to which the recently introduced system of Hospital Sunday is exposed, and at the present moment it may be not inappropriate to review them. Of course, if the contributions thus collected are to be regarded as so much supplementary to the ordinary contributions on which the hospitals have hitherto relied, they may be gratefully received. There are perhaps some institutions which already have rather more money than is good for them, or which make a doubtful use of it; but, on the whole, there is ample scope for expenditure in this direction. The question, however, assumes another aspect if the tendency of Hospital Sunday is, as we fear, not so much to add to the general stock as to divert into a new channel some at least of the money hitherto given to the hospitals. The results of this mode of appeal have certainly not as yet been remarkable for their success; and it is idle to disguise that it is regarded with a distrust which would seem to be rather increasing than diminishing. In the first place, it is evident, from what is known of human nature, that an appeal on behalf of charity in general can never be so telling as an appeal on behalf of a particular form of charity of which a precise detailed account can be given, and which elicits special sympathies. A poet has justly remarked how poor a thing the love of all is to the love of one, and there is always something flabby and artificial in that sort of enthusiasm which is supposed to be simultaneously and equally extended to the whole human race without regard to divisions and distinctions. The sort of love which professes to love all the world is usually of very small account to anybody; but a man, as a rule, really does love his wife and his children, and after them his country, and is willing to do something handsome on their behalf. Experience has shown conclusively that human nature is, after all, an extremely limited thing, that it fastens most closely and sincerely on some object the individuality of which is close to it and clearly seen, and that, when spread too far, it becomes thin and visionary. Most people who are honest would admit that they care extremely little for mankind in the abstract, or for people whom they do not know face to face, or at least fancy from reading or report that they know. The old proverb about charity beginning at home is an illustration of this truth, and the whole policy of Hospital Sunday runs directly counter to it. What, in effect, is said to people who are disposed to give money is, "Do not trouble yourselves to consider whether this asylum, or hospital, or dispensary, is most deserving of support. Listen to the words of the preacher enforcing the vague duty of philanthropy in general, and of benevolence without reference to anything in particular, and try (if you can) to become enthusiastic in your sympathy for every kind of misery and disease all at once and in a lump sum." A sermon of this kind must necessarily be dull and unimpressive, inasmuch as the interest and vividness of a discourse lies not in generals, but in particulars, and the contemplation in mass of the enormous, overwhelming, and utterly helpless and hopeless misery of a large part of the human species is simply paralyzing. What a drop in the sea is a five-pound note in such an ocean of chronic agony! What is the good of trying to fill a hole that opens at the bottom into endless space? These are the reflections forced upon an audience which listens to comprehensive declamation upon human distress. Nobody ever yet did much good to the world who did not begin by confining his attention to some small speck or spot in the human system, and endeavouring with all his might to rectify that particular blemish, with faith in the principle that every little thing helps towards the big aggregate.

But then it is said, Ah, but these Hospital Sunday gentlemen undertake to look into the affairs of all the hospitals and asylums and dispensaries, and to determine exactly what is due to each, and which should have nothing. We desire to speak most respectfully of Sir C. TREVELYAN and his colleagues, and nobody, of course, can for a moment doubt their disinterested devotion to the cause they have taken up. Still, they are only human beings, and therefore not absolutely infallible. They have prejudices, crotchets, fancies of their own; and if the distribution of charity is to be entrusted to a Committee, we should prefer that it should be handed over, not to irre-

sponsible persons who have appointed themselves because they believe in themselves above everybody else, but to some public Board of responsible officials, upon whom the criticism and votes of Parliament could be brought to bear with good effect. As the matter stands, it seems to us that the Hospital Committee is simply offering an encouragement to the laziness and carelessness of people who wish to be charitable without taking the least trouble to think what charity really means, or how it can best be carried out. It is such an easy thing to compound for a good conscience by a small money donation. What is wanted is that people should give not only money, but close, keen, interested personal attention to the affairs of the charities. The managers of a charity, however eminent, honourable, or honest, are not to be trusted by themselves; the jealous and efficient supervision of subscribers is indispensable to its permanent good management; and Hospital Sunday necessarily strikes at the very root of this principle. If people really want to do good in this way, they must do something more than give a lump sum as a salve to their own feelings; they must put themselves to the trouble of singling out some institution which they think deserving, and make a point of looking closely into its management, and touching up the managers whenever it seems necessary. If it is a badly managed place which they take to, so much the better, as it may lead to reform. There can be no doubt that a great many charitable institutions are shamefully jobbed, and the reason is simply that they get money, and no looking after. We need not point the moral of these remarks at the present moment. Let people who wish to give by all means choose some object of charity in which they believe, and insist upon a clear and complete account of it, and a right to express their opinion on its management. If they are at a loss which to choose, they can scarcely do better than send their offerings to the box of the police-court of their district. The magistrates know more about real distress than most people, and they are usually practical men of the world, and not fanatics or sentimentalists.

THE YEAR.

TIME brings every thing to an end, and this year has seen the end of the Tichborne trial and of the Gladstone Ministry. When the year opened Dr. Kennedy was still engaged in the process which he has since described, with more than his usual accuracy, as that of "keeping the Judges at bay"; and the Druids who assembled on New Year's Day at Oxford could little have dreamt that, before many months had gone by, one of their members would have retreated from the cares of administration to the serene seclusion of the House of Lords, and that the other would have exhibited himself as the chief adversary of Mr. Gladstone out of office. Stroud in the early part of January returned a Conservative in place of Mr. Winterbotham, but there was nothing to indicate that this would be regarded as a matter of much importance by a Prime Minister who still commanded a majority of more than sixty. But Mr. Gladstone hoped that the Stroud election might be accepted as filling him with despair sufficient to warrant his appealing to the country on the great question whether it would like to get rid of the Income-tax, and let him have the opportunity of exhibiting a marvellous financial feat, the details of which he did not think it necessary to explain. To the astonishment of the country and his Cabinet he issued his Greenwich manifesto, and at the moment when it had been announced that Parliament would meet, new elections were held to ascertain whether the fish had been hooked and the constituencies would accept the brilliant bribe that had been offered them. The contest was fierce, and the country was startled and amused at the acrimony with which Mr. Disraeli referred to Mr. Gladstone's private devotions and the Straits of Malacca, at the sparkling vituperation of Mr. Lowe, and at the ingenious retort of Mr. Disraeli that he had allowed the University of London to return a member because this would ensure the return of Mr. Lowe, who could not possibly get in anywhere else, and who was sure to break up any Administration he joined. One Conservative success followed after another, a Conservative majority of fifty was secured, and Mr. Disraeli became Prime Minister. He formed a small Cabinet, judiciously selected, and he at once showed that he knew how to use his victory. He stamped on his Ministry the character of a moderate Liberalism, and he forbore from every appearance of triumphing over his fallen foes.

The new Parliament met on the 5th March, but only to elect Mr. Brand as Speaker. The new Ministers had to be re-elected, and it was not till the 19th of March that the House met for business. The Liberals who had survived the election had many absent faces to think over. A considerable portion of Mr. Gladstone's Cabinet had betaken themselves to the Lords, and an unkind fate had sentenced to banishment, not only the author of unnumbered woes, Mr. Ayrton, but many others of promise and reputation; the chief loss to the new Parliament being the absence of Mr. Fawcett, who,

however, was soon restored to his proper place when a chance vacancy occurred at Hackney. The Queen's Speech announced the proposal of a moderate list of modest and useful measures, and no one could have anticipated that out of this list scarcely any would be carried. At first all went well. Sir Stafford Northcote accepted Mr. Gladstone's surplus, and disposed of it as Mr. Gladstone approved, and was ready to own that he had not done anything very brilliant in taking off a penny from the Income-tax, and contributing perfectly free sugar to the historical breakfast-table. Mr. Hardy took over Lord Cardwell's estimate and schemes for the army, and although Mr. Ward Hunt interrupted for a moment the harmony of things by declaring that he had only had a phantom navy handed over to him, he was soon brought by his colleagues into a calmer state of mind, and agreed that, if he could but exceed Mr. Goschen's estimate by exactly one per cent., he should have a navy of which he would be proud. Mr. Cross was affability itself in dealing with his Licensing Bill. It appeared that the new Parliament was not disposed to recognize too unreservedly the debt of gratitude which his party owed to beer, and Mr. Cross was quite ready to let the House do as it pleased. He confused matters a little at first by stating that he had evidence to show that the local authorities disapproved of Lord Aberdeen's Bill, and then having to own, when he produced this evidence, that it pointed directly the other way. But he soon recovered himself, left the House to fix the hours of closing as it pleased, and once more made the magistrates supreme by leaving them to decide what was the meaning of the term "populous places." This did not look like strength in government, but it was very pleasing and conciliatory, as also was the adoption as Government measures of Mr. Mundella's Factory Act and Mr. Stansfeld's Rating Bill. The legal measures of the Session were pushed on success fully in the Upper House under the joint care of Lord Selborne and the Chancellor, and Home Rule was made the subject of a long discussion in the Lower House, which at least afforded the numerous House Rulers who had found seats through the dissolution an ample opportunity of proving that they had nothing to propose of a practical kind short of dismemberment of the Empire. Mr. Disraeli did his best to conciliate his Irish hearers by saying that everybody had been conquered and that the Irish had no reason to wall over having undergone the universal lot. But the subject was discussed in the absence of Mr. Gladstone, who after much hesitation had accepted the leadership of the Opposition on the understanding that he should be taken to be doing all that he could be expected to do if he spent his Session time in Wales.

But this state of repose was not destined to last. A Bill to which the rest of the world was profoundly indifferent excited the liveliest interest in Mr. Gladstone, and he left his mountains and his studies to thunder on the wrongs of the members of the Free Kirk, who were grievously vexed by discovering that the Established Kirk was to be relieved from those ties of patronage to escape from which had been the motive of the grand disruption. Scarcely had his thunders on this subtle grievance died away when he was still more profoundly moved by the Bill which, originally proceeding from the two Archbishops, had been taken up and largely modified by Lord Selborne and Lord Cairns. It was called a Bill for Regulating Public Worship in the Church of England, but was avowedly meant to afford a short and sharp way of putting down the "Ritualists." Mr. Gladstone took up the matter in his grandest and most serious manner, and proposed to move six Resolutions embodying his views on the general principles of ecclesiastical law. His party shrank from following him into the mazes of a theological discussion, and he had to withdraw his Resolutions in a manner sufficiently humble to have satisfied Mr. Disraeli if Mr. Disraeli had wished for nothing but a triumph over a rival. But the temper of the House had shown that the proceedings of a small section of the Clergy had produced a very strong feeling of irritation, and although many of his colleagues had professed themselves hostile to, or contemptuous of, the Bill, Mr. Disraeli suddenly resolved to make it a Cabinet measure, to press it on, and to throw himself on the Protestant feeling of the country. He had lived to become a Prime Minister and to make a Duke, but the curiosities of his success were not over, and he now proved that he had lived to become a Protestant champion. The House warmed to its work with an increasing zeal, and Mr. Disraeli found a ready supporter in Sir William Harcourt, who vigorously attacked Mr. Gladstone, accumulated ecclesiastical learning with extraordinary rapidity, established for himself a Parliamentary position apart from the fallen leaders of the Liberals, and could not find words strong enough to convey his love and admiration for Mr. Disraeli. The strife got so bitter that Mr. Disraeli actually warned the House of Commons against being led away by one of his own colleagues; but fortunately Lord Salisbury, who had the consolation of thinking that his chief was commenting on expressions that had never been used, had the good sense to take no notice, and the Ministry escaped the serious danger of being broken up almost as soon as it had been formed. Meantime another complication had arisen. The Ministry had at a very late period of the Session brought in a Bill to regulate the treatment of endowed schools, and the advocacy of the measure was entrusted to Lord Sandon, who put the views of his party in language stronger than was consistent with the general policy of Mr. Disraeli. The House spent many days in discussing the behaviour of the Commissioners whose office was at an end, and at last the discharge of their duties was transferred to the Charity Commissioners; but the Bill also laid down rules for interpreting instruments of donation, and these rules called forth the

strongest opposition from Mr. Gladstone, who on this one occasion was heartily supported by his party. Mr. Disraeli gave way under the pretext that he really could not understand the clauses of his own Bill, and so the business of the Session was brought to a conclusion, but not without the sacrifice of almost every measure the Government had intended to carry. In particular, the Judicature Bill, in carrying which through the Lords the Chancellor had shown great firmness and resolution, had to be abandoned, and the legislative achievements of the new Parliament dwindled down almost to a blank.

The Ministry was, however, far too strong to be shaken by failures in legislation, or even by suspicions of discord among its members. Mr. Disraeli had saved the country from the dangers of a Conservative reaction, and had taken a new step in educating his party by impressing on it that it ought to show itself worthy to be considered the party of Pitt and Grenville; and as soon as the Ministry was stamped definitively with the character of moderate Liberalism, it was possible to contrast its policy favourably with the wild dreams of the theorists who were eager to set up a new Liberal programme, and with the trivial crotchets on which Liberal candidates rely in appealing to constituencies. The electors of Northampton set in the autumn a useful example, by showing that a Liberal constituency could prefer a Conservative to Mr. Bradlaugh. Even Ireland has given little or no trouble lately; the Bar, which is generally the centre of activity, being absorbed in trying to demonstrate the right of the profession to have the prospect of appointment to an immutable number of judgeships, and the Home Rulers having occupied themselves with the very speculative question whether, if Ireland were separated from England, it ought to pledge itself to Free-trade as part of the bargain, and whether, if it did, it would be likely to keep to its engagement. In the same way it might be asked, if the sky fell and all the larks were caught, is it probable that antecedent arrangements for an equal distribution among the lovers of puddings would be faithfully observed? A party that busies itself with such problems is for the moment harmless. Lord Derby's foreign policy is as safe as a foreign policy can be. A little difficulty with Chili has been arranged, adequate compensation has been exacted for a gross outrage on an English Vice-Consul in Guatemala, and M. de Lesseps has been made to understand that he cannot vary his Canal duties as he pleases. In greater matters Lord Derby has managed to stand well with Powers of very various kinds, and he has been on one occasion aided by Mr. Disraeli, who very wisely has no time in explaining away a reference he was supposed to have made to Count Armin's trial. A wise reserve was exercised in the instructions given to the English representative at the Brussels Conference; and England, while not permitting the rights of belligerents at sea to be discussed at all, has kept clear of assenting to doctrines as to war on land which, under the guise of humanity, threaten to cripple the independence of minor nations. At home the Ministry has reached the end of the year without anything very exciting to distract it from the calm consideration of its common measures. The eccentricities of the electors of Stroud have perhaps raised a point of some little difficulty, as the reasons for permitting or refusing the issue of a new writ are nearly evenly balanced. It is, however, satisfactory to observe that the long series of election petitions to which the assembling of a new Parliament gave rise rather illustrates the minuteness of the points on which the loss or retention of a seat may turn than any general corruption in the constituencies. But the chief excitement of the closing months of the year has been religious, not political. Mr. Gladstone undertook to explain the theory of Ritualism, and explained almost everything about it except the matters that needed to be explained; and Lord Ripon's conversion afforded him an opportunity, not so much of owning that a person who rises to be a Marquis by having been an Earl may be a very weak man, although a member of the late Cabinet, but of showing that he had at last mastered the meaning of what has been taught for years at the Vatican. His pamphlet has, however, had two important consequences. It has revealed the incurable differences of religious opinion which separate the members of a body whose strength rests mainly on a supposed certainty and identity of belief; and it has greatly improved Mr. Gladstone's position with those sections of his countrymen who thought he was half a Romanist, while it has relieved him from an incubus by exciting the hostility of his Irish friends.

Fortunately England, like the greater part of the world, has been blessed with an abundant harvest; and this has done much to mitigate the distress which has been caused by a depressed trade, and by the continuance of the struggle between capital and labour. Mr. Gladstone attempted to prove to the Aston Hall colliers that men who do not choose to work ought not to prevent others from working; but reason is a feeble weapon in such cases, and men who are poor, ignorant, and dissatisfied are not likely to yield to anything but the stern logic of facts. For months a battle was fought between the farmers and labourers in the Eastern Counties, and it was only brought to a close by the labourers being made to see that even in harvest-time the farmers could do without them. Such a struggle could not fail to be an exciting one. It was aggravated at its commencement by an imprudent declaration from the Bishop of Manchester, ordinarily a cool-headed man, that the farmers must be mad to resist men who could burn their ricks; and it was also embittered by a decree of the farmers that their men must not belong to any Union at all, and by the outrageous violence in language of wandering agitators. The same lesson that was enforced on the farm-labourers has also been

brought home to colliers and iron-workers, who claimed that the high wages of two years ago should be perpetual, but have been gradually made to see that, if a business does not pay, employers will not carry it on. The year has been fruitful in appalling accidents, and although no one in a civilized country expects to be safe, it is not often that we are startled by events more appalling than the Thorpe collision, the Regent's Park explosion, the loss of the *La Plata*, and the terrible accident on the Great Western Railway which has just cast a gloom over Christmas. Socially, it is a comfort to think that not only did the Tichborne trial come to an end, but that it ended in an audacious impostor's receiving an adequate punishment, and that the insolent and intolerable conduct of Dr. Kenealy did not escape without retribution. But the efficacy of English criminal law has not been lately seen in a very advantageous light, and ruffianism has not only been more rampant than usual, but more successful. It is but slowly that the world grows better, and those who think to push it on the path of progress by a sudden heave are generally disappointed, although one of the most conspicuous of these persons, Sir Wilfrid Lawson, has lately gone about his task with such irrepressible joviality that one is half tempted to wish him more success than he is likely to obtain. It would be odd, however, if there were nothing out of the range of politics on which we could not dwell with satisfaction. Many persons have been made happy this year, for Mr. Disraeli, who understands human nature, is far too good-humoured a man to stay his hand when he perceives how easy it is to delight his fellow-creatures simply by making them baronets. A local decision has reserved Epping Forest for the recreation of Londoners, and the Government has wisely shown that it will not grudge public money for a national purpose, and by deciding to send out an Arctic Expedition has gratified the scientific world and given a new direction in which England can expend the admiration with which it always regards its navy. It was also found that England had taken a fair share in the preparations made to observe the Transit of Venus; and while astronomers were pleased to have new means of calculating the sun's distance, ordinary people enjoyed the thought that something was happening which had not happened for more than a century, and that it came off exactly at the right moment. Few things can properly be called "eminently reliable"; but if there are any, it is certainly the heavenly bodies. Of all the events of the year that of which we have most reason to be proud is the conduct and conclusion of the Ashantee war. Sir Garnet Wolseley was sent out unfettered and left to do the best he could with not very adequate means. He and his handful of men fought their way to the Prah, crushed the Ashantees at Amoaful, advanced on and burnt Coomassie, and by the aid of the timely arrival of Major Glover brought the King to sue for a peace which led to the downfall of the Ashantee power, and the establishment under Governor Strahan of an English Protectorate or colony from which slavery will soon, it may now be hoped, disappear. Nothing could have better shown of what an English general and English troops are capable, although such a success ought not to make us forget that, if we have good soldiers, we have very few of them; and the Duke of Cambridge has just closed a long discussion on the state of the army by pointing out that, if we do not wish to have recourse to conscription, we must offer our soldiers better terms. The peace of Europe may, we will hope, be preserved, and such incidents as the marriage of the Duke of Edinburgh to a Russian Princess and the visit of the Czar to this country really contribute much to a good understanding between nations. But there will always be reasons enough why we should wish our army and navy to be strong. We cannot help, as the recent annexation of Fiji has shown, the extension of our Empire, and the basis of empire, however this basis may be disguised, must always be military and naval power.

So vast an Empire as that of England must have its catastrophes to deplore, and although Englishmen are ordinarily wise enough to avoid interference with India and leave the government of this enormous dependency to those who alone know enough to rule it, they heard with horror the accounts, continually more and more gloomy, of the famine in Bengal. It was a tale of misery, destitution, and famine on a scale terribly great. But it soon became evident that all that man could do to avert or mitigate the evil was being done. Lord Northbrook was firm, enlightened, and resolute, and his worth was at once warmly and without hesitation recognized by Lord Salisbury, who continued to him the active encouragement and support which he had naturally received from his political ally the Duke of Argyll. In opposition to the opinions of Sir George Campbell, Lord Northbrook, fearing to throw the course of trade out of its usual channel, refused to prohibit the export of grain. But although Sir George Campbell was overruled, he stayed at his post with an heroic disregard of his own failing health, and he and his eventual successor, Sir Richard Temple, showed what could be done by wisdom and energy under such adverse circumstances. The difficulty was not so much to obtain supplies of food as to convey food to the districts where it was needed, and to prevent the permanent demoralization of the people by issuing relief without exacting labour, where strength to labour yet remained. Those who had to be fed were numbered by millions, and those who were made to work by hundreds of thousands. The members of the Civil Service and those who were employed to strengthen it were equal to the occasion, and difficulties which seemed almost insurmountable were overcome, until at last rain came in June and the famine was conquered.

Mr. Disraeli in the first flush of his accession to power had hinted that England might apply a part of its surplus to the relief of India; but more prudent counsels ultimately prevailed, and Lord Salisbury was able to borrow without an English guarantee all the money he needed in India. The Bengal famine, however, called fresh attention to the state of the finances of India, and when the Indian Budget was brought before the House of Commons, it was laid down as a principle of Indian finance that only the surplus of each year should be devoted to unproductive works, while money should be borrowed exclusively for works likely to be productive, and Lord Salisbury obtained power to appoint a special Member of Council to superintend the expenditure on public works. In other respects India has gone on tranquilly enough. There were riots at Bombay, owing partly to religious quarrels between the Parsees and their neighbours, and partly to a theory of the Governor that a riot must get to a certain point before military force could be used. Lord Salisbury dispelled this illusion by instructing the Governor that extreme constitutional theories could not be imported safely into India, and that there troops might be legitimately used to make a riot impossible. Some interest was also excited by the apprehension by Scindia of a person alleged to be the celebrated miscreant Nana Sahib, but it has since become more than doubtful whether a mistake has not been made and the person arrested is not some one else. However that may be, it was a striking tribute to the reality of English power that Scindia should hand over—as he supposed, or wished it to be believed that he supposed—a Brahman of the highest caste to certain death, and that the native community should have tranquilly witnessed the recognition of the superiority of the claims of English justice to those of popular superstition.

In the Colonial Empire of England the event most worthy of notice has been the framing of a Reciprocity Treaty between Canada and the United States. As Sir Edward Thornton, in discussing the terms of the treaty, had the assistance of Mr. Brown, the special representative of the Canadian Government, it may be supposed that the treaty is not disadvantageous to Canada; but it is doubtful whether the American Senate will satisfy the terms assented to by Mr. Fish, and it is obvious that the treaty may raise questions of some difficulty if one of its effects should prove to be that English imports into Canada are placed at a disadvantage as compared with imports from the United States. It is useless, however, to speculate on this until it is known how the American Senate is likely to deal with the matter; and the future course of American statesmen has become more than usually uncertain. The relative strength of parties has been changed, and the autumn elections have so far destroyed the power of the Republicans that a considerable majority of the House of Representatives will be on the Democratic side when the new members take their seats, and the Republican majority in the Senate will then be reduced to very narrow dimensions. General Grant has apparently been losing in popularity. He showed that he was superior to some of those whom he has unwisely permitted to surround him by vetoing the Inflation Bill, for which General Butler was responsible. But the odium which has attached to his party from the attempt to carry the Civil Rights Bill, and from the proceedings by which Kellogg has been upheld in power in Louisiana, the failure of the Republican policy in the South, and more than all perhaps the injudicious proposal to violate the constitutional traditions of the country by stating General Grant for a third term of office, have discredited the President, while they have alienated the country from the Republicans, without, however, seriously attracting it to the Democrats, who do not even pretend to have any policy of their own to recommend. The President's recent Message shows a commendable desire to see specie payments restored, and was moderate in the language adopted as to Cuba. The affair of the *Virginian* blew over more quietly than perhaps Spain had much right to anticipate, the vessel having fortunately foundered on its way to an American port. Probably, those who are afraid of the ambitious policy of the United States need not be much alarmed just now. General Grant was stopped in his schemes of extending the territory of the Union while his personal reputation and the power of his party were at their height, and he is not likely to be very venturesome now that circumstances are so much less favourable to him.

France is still under the Septennate. Whatever else is uncertain, there is no doubt that rather more than one of the years for which Marshal MacMahon was named President has gone by, and that he is where he was. The state of things is provisional, but the French have got used to living under a provisional state of things, and Marshal MacMahon maintains order, obeys the law, conciliates the army, and keeps down the strife of parties. The Duke of Broglie was his Prime Minister when the year began, and after having resigned in January and been forthwith restored to office, he was finally forced to retire by an adverse vote in May, but only to lose the name rather than the substance of power, as he is still credited with pulling the wires of the Marshal's policy. He could not retain his official position because he could not command a Parliamentary majority. He had aided in preventing the restoration of the Count of Chambord, and the friends of the Count of Chambord have revenged themselves by separation from the Ministerial party. After the resignation of the Duke in May, attempts were made in the usual way to form a Ministry, but they failed, and then the Marshal simply ordered certain persons to be Ministers, and they were Ministers, and got on fairly well because there must be Ministers, and there was no one to replace the Mar-

shall's nominees. The objects at which Marshal MacMahon's Government has aimed during the year are two. It has tried to make such changes in the administration and in the distribution of political power as would enable it to carry on the government of the country without the aid of a state of siege, and, if necessary, to face a dissolution, and it has tried to give a definite form and a definite existence to the Septennate. In order to attain the first object it sought to obtain from the Assembly the right of appointing the Mayors; and it obtained this right, and used it more freely than successfully, as many of its nominees were its secret enemies. But it has tried in vain to induce the Assembly to reform the municipal constituencies, so that no one should vote under the age of twenty-five, and a preponderance should be given to the largest taxpayers, and to reform the political constituencies, so that only one member should be returned by each constituency, and that the person elected should belong to the district he represented. It has equally failed to procure a Bill on the press sufficiently severe to make journals as submissive as the state of siege makes them. The Mar-hal's organ has been continually reminding the Assembly that it really ought to provide him and his Septennate with some show of fixed institutions. But the Assembly cannot be got to "organize the Septennate." The friends of the Count of Chambord have received instructions not to aid in organizing it, and they are numerous enough to turn the scale when the Left opposes the Government. So everything continues provisional. Meantime France is not unhappy. The harvest and the vintage have been exceptionally favourable. The Bank of France is accumulating a very large reserve of bullion in preparation for the resumption of specie payments. There is a deficit of about two millions sterling in the Budget, and the Assembly lost the services of M. Magne as Finance Minister by declining to adopt the taxation necessary to make good what is wanting; but sooner or later, in a country so rich and so determined to uphold its credit as France, some mode of permanently balancing the Budget is sure to be found. Immense efforts are being made to reconstitute the army on a scale that will give France once more a voice among nations. The foreign policy of France is also moderate, prudent, and conciliatory. The *Uniers* was suspended for a time to please Prince Bismarck, the *Océan* was recalled to please Italy, and Duke Decazes has not only recognized Marshal Serrano's Government, and answered the fiery Note of the Spanish Ministry with temper and courtesy, but has taken very stringent measures to prevent breaches of neutrality on the frontier of the Pyrenees.

The struggle of French parties continues, and it has become more and more evident that the real contest lies between the Imperialists and the Republicans. M. Thiers, after making a tour in Italy, where he was received with honours seldom paid to a Minister fallen from power, recently took occasion at Grenoble to sum up the results of his observations, and to pronounce that, as no monarchical restoration was probable, a Republic was the only possible form of government. It is also true that the Fusion has disposed for the time of the Orléanists, and the Count of Chambord took one more opportunity in July of proving himself to be impossible by issuing a manifesto against Parliamentary government. It is also true that the elections caused by casual vacancies in the Chamber have gone mainly in favour of Republicans. Nor is it a slight thing that politicians of all parties agree that, if there were now a new appeal to the existing constituencies, there would be a large Republican majority. The present Assembly does not even pretend to represent France. But, on the other hand, it is equally true that the Imperialists have gained ground greatly this year. The Prince Imperial came of age in March, and they thus have a definite presentable Emperor ready to come when he is called. The dissensions in the Imperial family have been, not headed, but they have been made unimportant by the proof that even in Corsica Prince Napoleon could incur an electoral defeat when it was known that the head of his family wished him to be defeated. It in the contests for seats in the Assembly the Imperialists have had some defeats, they can point to brilliant successes in the Nièvre, Calvados, the Pas de Calais, and Seine-et-Oise. It is not yet quite certain, but everything seems to show that the Orléanists, when they are convinced that a Constitutional Monarchy is impossible, will prefer the Empire to the Republic. But even this is not all. M. Thiers preaches a Conservative Republic, and in June M. Gambetta descended suddenly on Auxerre, and made a bold attempt to convince his party that, if it wished to succeed, it must abandon its old exclusive traditions and welcome into its ranks men high in social position and trained in statesmanship. At one moment it seemed as if M. Casimir Périer would succeed in obtaining a majority even in the present Assembly for organizing the Septennate in a definitively Republican shape. But recently it has seemed as if the extreme section of the Republican party was determined to show how powerful it is, and how tired it is of waiting on the pleasure of those who are willing to be its Conservative leaders. The return of M. Ledru Rollin in the early part of the year had perhaps no great significance; but in the election for Seine-et-Oise the Red party refused to withdraw its man, and two Republicans stood in opposition to each other; and in the municipal elections the success of this extreme section was so striking as to have made a deep impression on the country. The Reds would have their own lists carried, and they carried them. They voted down the Moderate Republicans almost everywhere, and their success in Paris itself was so great as to show that the history of the Commune has not inspired as much wisdom as

might have been hoped. It seems as if the real contest would be one not between Imperialism and the Republic of M. Thiers, but between Imperialism and a Red Republic, and nothing could better suit the wishes and purposes of the Imperialists than that this should be the issue.

The great rival of France has passed through a year of greater agitation than France herself. The elections to the Reichstag showed that while Prince Bismarck would command a satisfactory majority and was supported by almost all the large towns, even Munich being almost entirely represented by Liberals, yet he would be confronted by a compact Opposition containing no less than a hundred Ultramontanes; and although his Liberal majority was sure to support him on all serious questions, yet it was a Liberal majority, and could scarcely be expected always to approve his high-handed ways of going on. He induced the Reichstag without difficulty to pass a Bill for internment refractory priests in any part of the German Empire, and with some little difficulty he procured an enactment by which the press has been placed completely at the mercy of the Government; but there was a serious collision between the Government and the Chamber on the question of the amount of troops to be kept up in time of peace, the military authorities wishing the arrangement they favoured to be decreed in perpetuity, and the Liberals objecting to give up their constitutional control. A compromise was effected by which a number of men accepted by the Government as satisfactory was to be voted without discussion for a period of seven years. Germany is, in fact, armed to the teeth, and is determined to remain so. As Count Moltke said in the debates on the Army Bill, she will take fifty years to consolidate the conquests which she made in six months; and Prince Bismarck at a later period of the year openly avowed that Alsace-Lorraine must be ruled by force, that the proclaimed hostility of the deputies for the annexed provinces had, in spite of the conciliatory language of the Bishop of Strasburg, shown how hopeless it was to believe they were the friends of their ancient Fatherland, and that the conquered provinces must understand that Germany took them because she wanted them, and not because she cared to please them. In such a state of things the possibility of war is the first thought in the minds of German statesmen, and the Reichstag has been lately called on to sanction a measure for the incorporation in time of peace of the Landsturm. But if war is the first thought of Prince Bismarck, putting down ecclesiastics, which he regards as a measure of military precaution, is his second, if indeed it does not hold an equal footing in his mind. Archbishops and bishops have been imprisoned, a scheme for dealing with vacant sees and cures has been passed by the Prussian Parliament, fines have been imposed on ecclesiastically-minded ladies, and a priest has been arrested by soldiers at the altar. Provoked fanaticism found at last an avenger in a youth named Kullmann, who attempted to assassinate Prince Bismarck at Kissingen, and was ultimately sentenced to the light punishment of fourteen years' imprisonment. Not having killed Prince Bismarck, he did him a great service, as the popularity of the Prince was greatly increased by the outrage, and the Prince has been able to impute the crime of Kullmann to his Parliamentary opponents. More recently the attention of Germany has been engrossed by the imprisonment and trial of Count Armin. The result of the trial can scarcely be satisfactory to Prince Bismarck, for the Count has only been sentenced to an almost nominal term of imprisonment, and that on one small, technical, and doubtful point; and this sentence can scarcely be said to justify the rigour with which Count Armin was treated, or the bringing him to trial at all. On the other hand, in the course of the trial an opportunity afforded itself of showing clearly what has been the policy of Prince Bismarck towards France since the conclusion of peace, and, by way of contrast, what was the policy which Count Armin would have pursued if he could, and the enormous superiority of the policy of Prince Bismarck. Its sagacity, its breadth, and its complete accordance with the interests of Germany were so incontestably manifested that the nation is more proud of the Prince and more devoted to him than ever; and, within the last few days, when the Liberals were disposed to remonstrate against the arrest during the Session of a deputy who had contravened the wonderful Press-law now existing in Germany, a humble vote of admiring confidence in the Prince was passed as soon as it became known that he was not happy at Liberals joining in a vote with Ultramontanes, even when Ultramontanes appeared to be right according to Liberal principles.

Spain has been throughout the year in its normal state—no Government, no money, no army much worth speaking of, and a grand war raging all the time. The year broke upon a confused scene of Republican quarrelling; but, on the defeat of Castelar by a majority of twenty, General Pavia summarily intervened, dissolved the Cortes, and installed Marshal Serrano in a provisional dictatorship. The new Government had a stroke of good luck to begin with, for in the middle of January Cartagena surrendered, although many of the leaders and worst instruments of the revolt escaped in the *Numancia*. At first the operations of the Government against the Carlists were conducted with indifferent success. Bilbao was closely besieged, and on Moriones sustaining a defeat in attempting to relieve it, Serrano assumed the command, but only to make an ineffectual effort to break the lines of Somorrostro. At length Serrano handed over the task he could not accomplish to the veteran Concha, who achieved a brilliant success, and relieved Bilbao at the end of April. But he was not fated to do much more, for in endeavouring to take the Carlist stronghold of

Estella in June he was himself killed, and his troops sustained a serious defeat. All that the Government has since been able to do is to localize the war. Cuenca, a town only eighty miles from Madrid, was taken by a bold Carlist *coup de main* in July, and held for forty-eight hours, but otherwise the Carlists have not been able to pass the line of the Ebro. They have been shut up in a corner of Spain, and there they have carried on the war with chequered fortunes. In August Moriones gained an unimportant victory at Oteiza, and in September Tristany was unable to prevent the relief of the Republican fortress of Puycerda. Fighting has since been going on upon the very edge of France, and Irun was relieved by Loma and Laerna in the presence of a curious throng of French spectators. Whenever it has seemed as if the Republican generals might have done something really effectual, their hands have been stayed, and their inactivity has been variously accounted for by the supposition that the Government feared that their army when successful might pronounce for the son of Queen Isabella, and by the supposition that Serrano, who has now gone to the front, has been reserving the laurels of victory for himself. He has gradually made his Ministry more and more Conservative, and Sagasta is now his chief counsellor. And his Government, if not very successful otherwise, gained by a fortunate accident the dignity of being recognized by all important Powers except Russia. The Carlists, of whose barbarity in the hour of success there have been loud complaints on the part of the Republicans, took it into their heads to shoot, among others, a German named Schmidt; and this brought on them the wrath of the great Bismarck, who not only induced other Powers to join in recognizing the Government of Serrano, but sent a couple of German gunboats to the Northern coast of Spain. This naturally gave rise to a belief among those who did not understand Prince Bismarck that he was going to intervene actively, and to use the strength of Germany to put down the Carlists. But even before he had had an opportunity of explaining his real intentions this belief had died away, and every one now knows that the Carlist war will be allowed to come to its natural end, whatever that may be.

A slight difficulty disturbed the friendly relations of Italy with Germany early in the year, owing to the unwarrantable indiscretion of General de la Marmora, who chose to reveal secrets entrusted to his honour; but the difficulty passed away on the Italian Government undertaking to make such acts thenceforth legally punishable. The relations of Italy with foreign Powers are on the whole most satisfactory. England has taken a small step in an amicable direction by terminating its modest diplomatic representation at the Vatican; and France took a very important step towards the establishment of friendly relations by the withdrawal of the *Orléans*. The Minghetti Ministry received a temporary check in May by a defeat on a Bill by which it was proposed to enact that no document not properly stamped at the outset should be recognized by the tribunals; but it commands the general confidence of the country, and the autumn elections have furnished it with a sufficient and a sure majority. It may thus hope to carry out the two main objects of its policy—the repression of brigandage, which has grown to an alarming height in Sicily and in Southern and Central Italy, and the restoration of a balance in the national finances. With an army large in proportion to its revenues Italy cannot afford to dispense while it has its internal safety to care for, and while all the great Powers are continually augmenting their military strength; Russia having perhaps this year taken the greatest stride by abolishing all exemptions from the conscription, and creating an army which, it is said, will, if all reserves are counted, not fall short of two millions of men. Austria, like Italy, has its financial difficulties to encounter, and its exhausting army to maintain. But the position of Austria with regard to its neighbours is much better than it used to be. Prince Bismarck is reported to have said not long ago that any one who attacked Austria would have to count with Germany, and the visit of the Emperor of Austria to the Czar may be accepted as an indication of the increasing harmony between the two countries of which they are the Sovereigns. At any rate Austria appears to have been supported both by Germany and Russia in its recent controversy with the Porte as to its commercial treaty with Roumania. While every great Power is preparing for war no Power probably wishes for war at present, and peace has been preserved. But if there has been no great war this year, minor disputes and struggles have been going on all over our hemisphere. We have had our Ashantee war; the Dutch, although they took the Kraton of Acheen months ago, have not been able to bring their war in Sumatra to a close; Russia is being vexed by the insubordination of the wild Asiatic tribes whom she has only half subdued; and even China and Japan have seemed on the eve of a war about Formosa. Prince Bismarck lately said that the present is the quietest twelvemonth he has spent for thirteen or fourteen years; and, if he thinks the year a quiet one, others may agree with him. It has perhaps been a year that may be termed on the whole a quiet year, and, at any rate, it has not been marked by the occurrence of great events or the loss of many eminent men. The tidings of the death of Dr. Livingstone showed that one of the most simple, large-hearted, and adventurous of explorers had earned his fitting rest in Westminster Abbey. In the fulness of age M. Guizot has passed away, leaving the memory of a very mischievous statesman devoted to small schemes of repression and to the furtherance of Court intrigues, but leaving also the memory of a writer, clear, enlightened, and judicious. Mr. Sumner had for years distinguished himself by a morbid

hatred of England, and by using his influence to urge his party on to extreme measures, keeping alive civil discord and the hostility of races; but he had at least made his name well known, and even his adversaries recognized that he had higher and less selfish aims than are usually found in American politicians. In M. Van de Weyer Belgium lost one of its wisest and worthiest counsellors, and England one of the most valued of the foreign friends who have settled in it. Within the last day or two Lord Romilly has come to the end of a successful career on which he embarked with the inheritance of a great reputation, and in which he distinguished himself by high rectitude of purpose and by the display of a very rapid, if not very powerful, intellect. But, although the general peace has been preserved, although the harvest has been exceptionally good, although in some of the principal States things have become less disturbed than they were a year ago, and although few men of great eminence and prominent usefulness have passed away, yet it cannot be said to have been a very bright or prosperous or satisfactory year; and if it does not pain us to look back on it, it suggests the pleasing, though perhaps delusive hope, that it may be eclipsed by the year that is to succeed it.

CHRISTMAS.

PALEY somewhere says, with a touch of sentiment rather unusual in him, that he sees the benevolence of the Deity more clearly in the pleasures of very young children than in anything else in the world. The fact may probably be taken as sufficiently proved. It is very difficult to say whether the life of an adult has on the whole a balance of pain or of pleasure. The periods of lively emotion of either kind are brief and rare; and by far the greater part of our existence is taken up with a monotonous exertion of the faculties, too faintly coloured to be reckoned as decidedly bright or dark. But a young child, so long as it enjoys a moderate degree of health, seems to be running over with pleasurable excitement during most of its waking hours; and Paley adds, though the statement may be more doubtful, that it is even happier when asleep than when awake. The doctrine is a consoling one when we endeavour to balance the general account of the happiness or misery of mankind. It is sometimes lamented that so large a part of the race dies before arriving at the age of five. The fact is indeed lamentable, as a proof of the badness of our sanitary arrangements; but there is some consolation in the reflection that the statement merely amounts to this—that a very large portion of the human race is always in the happiest stage of life. If we add that an hour to a child is as long as a day to a grown man, we may further increase the proportion; and, after running over in our thoughts all the miseries to which flesh is heir, the diseases, privations, anxieties, and labours which make life a burden to so many of us, we may be glad that so many human beings are presumably happy, and are moreover extracting from each moment of life a much greater fulness of emotion than their elders. The period, indeed, passes away very rapidly. We have no great belief in the happiness of schoolboys, who perhaps suffer as much from the petty annoyances inflicted by their masters and their equals as they will suffer in after life from more dignified troubles, and to whom the slow passage of time merely means that the day of deliverance seems to be removed outside the narrow limits of their intellectual horizon. It is the still unconscious child, to which bare existence is still in itself enjoyable, that seems in some degree to justify Paley or the more poetical doctrine of Wordsworth. Perhaps even here we are in some degree falling into the common error of unconsciously imputing our own feelings to beings incapable of sharing them. Shelley holds that a lark must enjoy a gladness unknown to poets, the ground of the tacit assumption being that a man must be very happy indeed before he would clap his hands and shout at the top of his voice for hours. A lark, therefore, which performs the analogous operation must be constantly in the same state of exhilaration. The fallacy needs no exposure when it leaves the regions of poetry; and perhaps our view of children involves something of the same error. The child's absolute freedom from our cares is taken to imply that it has none of its own. We will not, however, look too closely into what is at least a pleasant and a harmless illusion. A child is at any rate a creature susceptible of happiness at a very cheap rate, and that is enough for practical purposes.

Christmas, at all events, as the period at which the old are deliberately sacrificed for the benefit of the young, is a time at which we are anxious to believe in this soothing theory. The whole paraphernalia of Christmas rejoicings are a weariness of the flesh to all persons who are, let us say, as old as a man ought to be. They are perfectly well aware that a sharp frost and a deep snow is a nuisance not the less vexatious because it justifies illustrations in the newspapers. Christmas bills have too long been the property of satirists to permit of more than an allusion. And, again, one must be very amiable or very easily imposed upon not to find out by middle life that a family party is an almost unmitigated evil. The two conditions of a pleasant society are variety and freedom from constraint. The persons who meet should not be too much alike; and they should be able to discourse upon any subject that strikes them. Now a family party is necessarily more or less monotonous both in character and surroundings; and the mixture of old and young necessarily imposes a certain

constraint, as conversation is forced to run upon the narrow round of topics common to both. The only relief is in some of those amusements which become every year less amusing. And therefore the whole population which is above the age of thirty probably looks forward to Christmas as to a painful operation which must be undergone for the benefit of the rising generation. Self-denial is supposed to be a healthy process; but it becomes especially painful when the victim is obliged to affect enjoyment. The only safety is for the elders to efface themselves as much as possible, and to be spectators and ministers to infantile enjoyment. That, indeed, is an occupation which has its charms for everybody who is not an unmitigated brute; but it must be accepted frankly and with a distinct recognition of the vicious nature of the happiness. To look at pantomimes through childish eyes, and enjoy mincepies with childish palates, is a charming employment for an elder; but he must be very careful to keep his own mouth and eyes as much closed as possible.

We may indeed be tempted to wish that some better arrangement could be devised for conciliating the claims of the two ends of life. Hypocrisy is more or less a bad thing, even when it is imposed upon us by a desire to promote the happiness of our children. Why cannot infants be happy without dragging their parents at their chariot wheels? Of course it would be a pity that our darlings should not have the fullest chance of indigestions and colds; and we must act the part of nurses and tutors. But Christmas, in its social aspects, should be avowedly for the young; and the elder actors need not keep up the farce when the curtain is dropped. When the children have been sent to bed, we might consult our own feelings by putting on sackcloth and ashes and doing penance for the sins of the past year. If this cannot be, we may console ourselves by reflecting that the sacrifice we make is not without its advantages. Young children are the great conservative force in society. A lad begins to grow subversive when he leaves his nursery, and may probably be a rabid revolutionist when he goes to college. But an infant just able to talk is the most bigoted of all Tories. It resents the smallest change in the admitted ceremonial as if it were a hundred years old, and had done precisely the same thing in every preceding year. If a child at three has been amused by the simple pleasure of pulling a "cracker," crackers become sacred objects to its mind, and, however feeble its memory, it would regard the omission of crackers when it was four as an idolater would regard an insult to his favourite god. Children not only insist upon having stories told to them in the same words which were first used, but it seems as if by some curious instinct they insisted upon having the same stories which were told to their forefathers. The ancient myth survives in the nursery tale when everybody else has forgotten it. The child is not only "father of the man," but ancestor of the race. He preserves, as might be illustrated in a hundred ways, the same instincts and modes of thought and language which were characteristic of the race in long past generations. We might fancy that, as new comers, children might care less for the traditions of the community than those who have had time to grow familiar with them. But the very reverse is the case; and, as we sometimes see in later life, the latest neophyte is the person by whom the symbols of the traditional creed are most reverently cherished and most ostentatiously displayed. Whatever primitive ideas are retained owe their vitality in great measure to the wants of children. Fathers of families, we are told, are capable of everything; certainly, they are capable of sacrificing their convictions to the interests, real or supposed, of their offspring. The most determined freethinker will often affect a belief in ancient creeds for the benefit of the rising generation; and we are told that infidelity is checked in certain foreign countries because the infidel prefers that his children should hold the creed which he most despises to their holding none. It is not for us to argue how far this is justifiable from the point of view of those who indulge in the practice. But it is at any rate a general law that doctrines as well as ceremonies survive in some shape so long as they have charms for children. Probably even in America fairy princes still give a monarchical tinge to the politics of children's stories; and it is not as yet a President who is shut up by a malignant witch in a tree or transformed into a beast. The child is of necessity an implicit believer in authority, and is not tormented by having to expose his little store of beliefs to the action of critical inquiry. Perhaps this is one secret of his happiness. But, at any rate, in keeping up even the more useless forms of Christmas ceremonial for the benefit of children, we are simply illustrating the ordinary process of development. If grown-up people could consult their own tastes without reference to the youngest members of society, changes would take place with startling abruptness. The tendency would be to give up everything for which we could not offhand assign a sufficient reason in black and white. We need not pause to prove that, along with a good many puerile superstitions, we might in that case get rid of some of the most essential social bonds. But the infantile part of the community acts like the buffers and brakes in a railway train. It slackens the pace and softens the collisions, and thus may enable progress to take place without involving too many thrilling catastrophes. Some such reflections may be useful to reconcile our minds to the many hardships of the passing season. We would not be more hypocritical than is strictly necessary, and we would reserve an unlimited privilege of grumbling behind the scenes; but we would remember that there are few exertions of human energy which produce a more tangible product of unalloyed happiness than contributions to the pleasure of children, and for that reason

we would look as leniently as we can even upon threadbare illusions, and treat the most faded sentimentalities with some shadow of respect.

ARLES.

THERE are not many cities in Europe which have, either in formal or in common use, given their names to kingdoms. Perhaps it would be more strictly accurate to say that there are not many such cities out of Spain. For, in the long roll-call of titles of the monarchs of Castile and Aragon, nearly every city conquered from the Saracen in Southern Spain is made to do duty as a separate kingdom. Another city, long a dependency of the crown of Aragon, has given a royal title both in popular, and sometimes in formal, phrase. "King of Naples" was the common way of speaking of the King of the Two Sicilies, and, at one or two moments, when the two Sicilies were distinct, it was a title in formal use. We should remember that it was Philip, King of Naples, who married Mary, Queen of England, France, and Ireland. In later times the world has seen a King of Hanover and a King of Rome, the latter being perhaps so called in the mistaken hope of reviving the exact description of L. Tarquinius Superbus. In the happily distinct style of King of Lombardy and Venice, we ought perhaps to look on the district of Venetia rather than the city of Venice as helping to give the royal title to the intruder. Wurtemberg is an odd case of a kingdom called, neither from a district nor from a city, but from a hill. There may likely enough be other cases among smaller and obscurer kingdoms; but there is at all events one case in a kingdom which, if now almost forgotten, was neither small nor obscure. It is hard to say what was the formal style of any king in the ninth and tenth centuries. For the most part kings of that age call themselves simply as "Rex," while other people describe them as they think good. And, in this way, Arles has become so well known a name for one stage of the shifting Burgundian realm that Arles may fairly be reckoned among the cities which have given their names to kingdoms. It was the royal city of the successors of that Boson who so prudently described himself as "*Dei gratia id quod sum*." And in the long business of investing the later Emperors with their many crowns, a coronation at Arles was as needful to the ideal perfection of the process as a coronation at Aachen, at Milan—ought we to say at Monza?—or at Rome itself. It was not indeed every Emperor who found time to go and seek his fourth crown by the Rhone, but the crown was to be had if he chose to seek for it. And two at least, one of the greatest and one of the least of the Imperial series, really took the journey, and became Kings of Arles, of Burgundy, of the Middle Kingdom, before the high altar of the metropolitan minister of St. Trophimus.

The appearance of Arles now is hardly that of a royal city. Nor is its general effect that of one of those cities where the stamp of antiquity and of past greatness is impressed on every stone. It contains a number of ancient remains of the highest importance; but, the moment we are out of sight of any of the great monuments, we have to thread our way through narrow, crooked, dirty, ill-paved streets, without even the solace of a palpably ancient house at every step. And in no city built on a great river does the river enter so little into the general effect of the city. The broad Rhone is there; we look down upon it from towers and high places: we find our way to it in the course of our rambles through the streets; but it does not give us the impression, as one would have thought that so great a river would, of being one of the great objects which give the city its character. The Rhone at Arles is not, for instance, like the Rhine at Basel or the Adige at Verona, like the Sarthe at Le Mans or the Aar at Bern. There is nothing of any importance on the other side; no Deux or Kleinbasel or Ehrenbreitstein. In fact, with rivers of this great width, a suburb on the other side must assume somewhat of the nature of a separate town. And, in the days when Arles was a royal city, it was the frontier town of its own realm. The Rhone was, no less than the Roder, "*Romani terminus imperii*." A post on the other side was always a doubtful and dangerous holding, open to the assaults or intrigues of the "*Latine Francie Rector*," or of his vassals. Yet we might have looked for the royal city of Burgundy to have its Peruvia, so to speak, at least its Janiculum, on the other side of the boundary stream.

The antiquities of Arles belong almost wholly to the earlier periods of its history. Except the manifest fact that Arles is no longer one of the great cities of Europe, there is little to remind us of the days either of Angevin Counts or of Valois and Bourbon Kings. There are not, as in some of the cities of Southern Gaul, stately buildings whose palpably French style, in marked contrast to the character of the native work, brings the fact of their French annexation home to us. The mediæval buildings of Arles are few and of slight importance. Two or three church towers and spires of no great mark, and here and there a doorway or a window, Burgundian rather than French, are about all. It is its Roman remains which make Arles chiefly famous. But the ecclesiastical position of the city must not be forgotten, least of all by Englishmen. Arles has been the seat of more than one ecclesiastical Council, and it was to Arles that the Apostle of the English went to receive his consecration to the newly-created metropolitan see of England. So much for history; we have heard a further point of connexion between Arles and England set forth by a zealous curate, to which the only objection is that it involves a confusion between Briton and Englishman, between the Ligurian and the Bithynian Nikias. "What reason,"

says the catechist to his young flock, "is there for thinking that there were English Bishops at the Council of Nice?" "Because," the lambs are taught to bleat in answer, "there were English Bishops at the Council of Arles." The argument is plain; if they could go as far as Arles to a mere provincial Council, the attractions of the oecumenical assembly would surely be enough to keep them from shrinking from so small an addition to their journey as the space between Arles and Nizza. One Council, later than this, but still earlier than the conversion of the English, is commemorated by a somewhat apocryphal inscription in the small Romanesque church of St. Mary, a church on which local tradition is inclined to bestow an incredible antiquity. The inscription is in French, but it purports to be a translation of a destroyed Latin one. Can we believe in an inscription which, properly enough, records Valentinian and Marcian as Emperors, and Opilio and Vincomalus as Consuls, but which dates further by the fifth year of Meroveus, King of the Franks, and even by the year 453 A.D.? But, leaving these matters, great as is the value of the Roman remains of Arles, they must not be allowed wholly to overshadow St. Trophimus and his metropolitan church. The western portal, one of the most splendid works of the later and richer Romanesque style, is well known; so is the cloister, partly of the same date, partly early pointed or rather Transitional; one of the best examples of that type of cloister where the arches rest on small coupled columns. But the church itself is worth some attention, especially for those to whom the peculiarities of Provençal architecture may be new. Like so many of the cathedral, and even metropolitan, churches of Southern Gaul, it is small and plain, if judged by a French or English standard; but it is thoroughly local, and within at least—outside it is so blocked up that hardly anything but the tower and the west front can be seen—it is certainly not lacking in stateliness. The Provençal type of church, something strangely, considering the abundance of Roman remains, eschews the basilican tradition with its columns and flat roofs. It affects rectangular compound piers, often of great height; the naves are covered with pointed barrel-vaults, while the same shape is often given to the arches which support the central towers or cupolas. But here the pointed arch is no sign of coming Gothic; it is rather, as in Sicily, a remembrance of the Saracen. Instead of regular aisles, there are often cavernous recesses in the thick walls, and there is often a singular lack of windows. St. Trophimus however, though otherwise conforming to this type, has regular aisles and clerestory. Its eastern part is of later date, but it keeps its tall central tower of a very classical Romanesque; and this tower groups in a most striking way with the two surviving columns of the Roman theatre, which still stand, reminding one of their fellows in the forum of Rome itself. The two periods of the greatness of Arles are thus brought close together. The theatre and its columns speak of what the Roman colony was in the days of the elder Empire. They tell of the city which, when the Mosel was threatened but the Rhone was still deemed safe, supplanted the distant Augusta of the Treveri in such honours as still were left to it. The days were past when either Trier or Arles was likely to be the dwelling-place of Emperors. For that doubtful honour there could now be no claimants save the New Rome by the Bosphorus and the impregnable stronghold of Ravenna. But, now that the German was thundering on the frontier, with no Julian or Valentinian to drive him back, Arles rose to the place once held by Trier—the home of Julian put in no claim—as the local head of the Gauls. There it was that Honorius and the younger Theodosius strove in vain to gather those Congresses or Parliaments of the Gauls to which no Gauls could be got to come. But above the relics of those days and of earlier days rises the monument of times when Arles again saw Emperors within her walls, but Emperors who did not deem it beneath the majesty of the Roman Augustus to add to his Imperial dignity the titles and badges of a local Gaulish kingdom. At Arles, in the church of St. Trophimus, before the high altar over which the lofty tower rises, the first Frederick, already King of Germany and Italy, already Cæsar and Augustus, added the crown of his Burgundian kingdom to the crowns of silver, iron, and gold. And, as it were a shadow, almost a mockery, of that great age and its hero, Charles of Bohemia, nearly two hundred years later, found his way to the same spot on the same errand.

The theatre is the point where the two eras of the city's greatness, as the Roman colony and as the royal city of Burgundy, are thus most closely brought together. And the two columns standing erect, and their broken fellows beside them, have their special charm. Save where a city has the exceptional good luck of Nîmes and Vienne, it is rare on our side of the Alps to see a piece of ornamental classical architecture standing in its place. Theatres too, in any state at all near to perfection, are much rarer than amphitheatres, and the remains of the theatre at Arles, though, save in the matter of columns, not to be compared to that of Orange, are really unusually large. Otherwise the amphitheatre of Arles is a far more perfect monument than its bloodless neighbour. Both of them have a feature of special interest in showing distinct traces of the time when, like most other remains of Roman times both at Rome and elsewhere, they were both used as fortresses. At the one point of the theatre where the full height of the arcades is most perfect, the fragment thus standing free has been used as one side of a tower, and several towers attributed to the time of Saracen occupation have risen at different points of the circuit of the amphitheatre. The amphitheatre itself is well known as one of the largest and best preserved in the province.

and, with regard to questions that have been lately stirred, it is important to notice that the present arena comes immediately upon the rock. There are therefore no signs of any of those underground constructions which are so marked in the amphitheatres of Rome, Capua, and Puteoli, and which it is clear once existed in Arles's nearer neighbour of Nîmes. Without going into any of the disputed points as to these buildings, common sense is enough to teach us that different arrangements were likely to be followed in different places according to the local circumstances of each; but it is right to say that the preparations for the barrier to defend the front seats from any possible accidents caused by enraged beasts are as clear at Arles as anything can be.

The amphitheatre, from its size and stateliness, and its remarkable preservation, forms the most conspicuous feature in this, which we may call the Roman, quarter of Arles. But besides theatre, amphitheatre, and metropolitan church, we light at every corner on some fragment of Roman or Romanesque date. We have, already mentioned the church, not very attractive in itself, but containing ancient portions, which claims to be the seat of at least one of the Councils of Arles. At another part of this quarter, near the town walls, we come across other ecclesiastical buildings, now disused, and among them a small apse with pilasters of singularly classical character. The walls themselves, though not for a moment to be compared to those of Aosta, still retain large Roman portions, and one at least of the towers has been in the same way altered according to mediæval notions of defence. But one of the chief attractions of Arles lies beyond the walls. A suggestion to visit the *Champs Élysées* is not attractive to the antiquarian mind; but change the spelling into *Alcaïques*, and say that it contains the Romanesque church of St. Honoratus, which we remember in a drawing of Mr. Petit's, that it is approached through the remains of a rich contemporary gateway, and that the path leads through two lines of tombs of various dates, which, though the analogy is only superficial, cannot fail to suggest the street of tombs at Pompeii—then the nature of the invitation seems altogether changed. The half-ruined church brings out the features of the local Romanesque in all their fulness, except that the usual square form is forsaken in the lantern arches for vast round piers, reminding us of our own Southwell, and Malvern, and Hereford, and Gloucester choir. And the tall central octagon which they support, contrasting well with the square tower of St. Trophimus, shows that, with all its plainness and severity, the Provençal style could on occasion reach to a measure of lightness and elegance from which one might have fancied it debarred. And more striking still is a visit to the not far distant monastery, churches, and tower of Montmajour. The rocky hill on which they are seated, looking forth on a hill yet more rugged, on which one feels that some traces of primeval dwelling and primeval defence ought surely to be found—the huge fortified tower which forms the most prominent object, the vast fragment of the great church, with all the stern simplicity of its spreading apse, the cloister only not rivaling St. Trophimus, the lower chapel calling itself the confessional of St. Trophimus, and claiming (perhaps not without reason) an antiquity which carries us back to Rome, Ravenna, or Trier—all this shows perhaps not to the least advantage when twilight hinders much minute study of mere detail, but when the rising full moon brings out almost more distinctly the outlines of hill and tower. At such a moment we can almost forget that even on the hill of Montmajour the days of monastic bad taste once had their sway, and that a large part of the actual ruins consists of conventual buildings not unlike those which encumber the minsters of Caen and Rouen. And beyond the great monastery stands that unique chapel which must have impressed itself on many memories as forming the frontispiece to one of Mr. Petit's volumes, the four apses clinging to the central lantern, the group being disturbed only by the contemporary porch attached to the western apse, the northern side absolutely without windows; the strange interior, all apse save the lantern, vaulted in a fashion which suggests the kitchens of Glastonbury and Fontevault and Avignon. All this, though we must give up the legend which assigns the building to Charles the Great, shows that the men of the early part of the eleventh century were somehow possessed of considerable skill in the use of building stone, and that Montmajour is to be classed along with Rome and Winchester and a few other places as among those exceptional parts of the world where everything was not built of wood. No one who pays a visit to the royal city of Burgundy should turn away without paying a further visit to the hill and churches of Montmajour, and if he should chance to visit it by the pale moonlight, he will find that, though Montmajour has no alternate buttresses to seem carved in ebony and ivory, yet its strange and varied outlines give as much play for the magic effects of light and shade as the later and more elaborate forms of mediæval art.

SECOND CLASS.

IT is easy to draw a line between the upper class and the lower; but who shall say which is the middle class? Every man has his own idea on the subject, and probably accounts those who are slightly below himself to be of the middle class. There are other ways of making the distinction, but it is hardly worth while to go into them. One method is about to be taken away from us by the abolition of second-class carriages. If the railways generally adopt the proposed system, much confusion of ranks will occur; and though some may be able to bear up under the

circumstances, and even to preserve their equanimity, there can be little doubt that to a large number of very worthy persons the change will be exceedingly inconvenient. Many people now hovering in an intermediate position, or literally in a middle class, will have their actual place defined, and the second class is essentially indefinite.

There are people who may travel by any class they please. There are people who not only say they do, but do "go third, because there is no fourth." But there are people who cannot "go third." A peer, an honourable, a baronet, some of the higher grades of the clergy, may do so if they choose, and they probably will choose under the new system. A man who has an assured position, whether by rank, wealth, or talent, can take any place in a train without derogation. He may "go third," because every one who knows him knows that he is great and rich, and can afford to travel by the first class, or that he is great and not rich, and may economize if he pleases. His actual place and standing in society are not in the least affected. He is lord of himself and may use his heritage as he pleases. On the whole more people are born into this position than come into it of themselves. The newly rich or the newly great seldom attain to that conscious independence which is the only guide to safe action. A knight can scarcely make up his mind to travel except first class; but a baronet may "go third." So, too, a country squire will travel in the second class, though his own tenant is in the first. The commercial traveller, who now often ventures into a second class, can never go into a third. He might, by so doing, bring disaster on the firm he represents. These are the people on whom the abolition of the second class will act; their position will be clearly marked, so far at least as railways take them; and while some who have hitherto been contented with a middle rank will be obliged to mount up a step, others struggling on a border land will be pushed down. Mr. Reginald Fitz Plantagenet de Hogson, who has perhaps as much as a couple of thousands a year, and a position to keep up, must always travel first class, whereas he used often to go in the second when no aristocratic friend was there to see. On the other hand, the "Honble. and Rev." the vicar of M. de Hogson's parish, who has perhaps half his income, and who habitually went in the second class, will now always "go third." And the grocer's wife, the apothecary's daughter, the schoolmaster, the organist, the lawyer's clerk, all those to whom the second-class carriages were specially appropriated, will have to face a highly puzzling alternative. And these are the people who may be strictly called the middle classes.

Second-class people have certain characteristics in common. They do not dress alike, nor have they any particular accent; but the ethnologist who wishes to study their habits can have little difficulty in identifying them. They are often, may usually, very polite, especially to each other. They are also pious, in an eminent degree. Regular attendance at chapel involves piety. They do not go to church, but prefer the meeting-house, for obvious reasons. Better to reign there than to take an inferior place at church. And their piety is only equalled by their decorum. Even their scandal is delicately expressed. They hide its more repulsive features under a veil of carefully selected words. They would blush to mention a divorce. The court in which such legal events take place is better called the Probate Court. They never use terms which could possibly be taken to imply any acquaintance with medicine or surgery. Anatomy, of course, is too horrid to be thought of; but some of their distinctions are a little difficult to understand. The stomach can never be named, under any circumstances; although there is no impropriety in speaking of the lungs. Hands and feet may be distinctly alluded to; but arms are doubtful, and legs are wholly unmentionable; for both the word limb has been judiciously substituted. Second-class people are also very particular in matters relating to births, deaths, and marriages. The possibility of a lady having a child is never to be thought of; but when such a mysterious event as a birth takes place, it is described by means of various foreign phrases, and any reference to its having been expected is carefully avoided. Superstitious observances regarding marriages are common among them. No lady of the middle class would consent to be married on a Friday; and at the cost, no doubt, of great suffering to the whole wedding party, the clergyman who officiates is expected to read the entire service. To be bridesmaid a third time, to take off the wedding ring, to break a glass at the breakfast, to let the bride's mother appear at the ceremony, all these are things of bad omen, and must be avoided. Deep and long mourning is also a rule. There is a reason for this. Slight mourning, lasting a short while, is costly. It involves several changes of raiment, and so belongs to expense. When black garments are once assumed, they must be retained as long as possible. The alternative of never wearing them, except for very near relatives, is not considered. A gentleman of this class will wear crape to the top of his hat, and, for the rest, dress like a clergyman during two whole years after the death of his mother-in-law, although that melancholy event caused him sincere joy. In the announcement of deaths, too, the middle class is curious. They like to specify the exact complaint of which the departed has died, and are scrupulous to add that he is lamented. We sometimes read that he died after "a short but severe illness," although we might have judged of its severity by the result. When a long name can be given to the disease, so much the better. When children die, their loss is announced in a manner peculiar to the middle class. The father's and mother's names are given in full, without any prefix. The results of this

custom are often of a disagreeable character. When the father, for example, is Mr. John White Black, and his wife's name Mary, the announcement mentions the death of the child of John White and Mary Black. Ignorant or ill-natured people might infer that the deceased belonged to the same category as William the Conqueror or the Duke of Monmouth. When a gentleman dies, his name is put in the first column with the prefix "Mr.," by which the observer may at once fix his rank. People of this class are also remarkable for their skill in calling things by their right, or at least their most proper, names. It is to one of them that the vegetarian public is indebted for the change of rhubarb into "spring fruit"; it is to be feared, however, that many of them also speak of "sparrow grass." A lady coming out of a shop saw, as she believed, a cab standing at the door. She asked the driver if he was engaged. He looked at her for a moment with great dignity as he replied, having no doubt been well instructed by a middle-class mistress, "Madam, this is a private carriage." Jam becomes "sweetmeat," lollypops are metamorphosed into "sugarplums," and by a still more awful and mysterious process gooseberry wine becomes "champagne," and marsala "sherry." The middle-class lady never speaks of her husband, but always of "Mr. So and So." A thrill of horror passed throughout the length and breadth of the country when on one occasion the Prince of Wales was reported to have mentioned the Princess in a public speech as "my wife." It is perhaps wanton to revive such painful subjects, but this matter was much discussed at the time, and an error of the reporter was usually invented to account for the Prince's expression.

But there is another and very different side to the picture. In the ranks of the middle class there are many people to whom none of these remarks apply. The retired commander who is seen in a third-class carriage knows that on the morrow his butcher's bill makes its appearance, though his quarter's money is not due for weeks to come. The half-pay captain who struggles to keep his boy at school, or to give him a good coach for his army examination, may travel second class with impunity, but if any of the people of his town see him in the third the consequences will be awkward for his credit. These are the people on whom the new system will tell most unpleasantly. There is the late vicar's widow, who annually takes her daughters to see their fine relations in the North. They take second-class tickets to the junction, and then change them for the first, so that the servants may not see them in a lower place. And there is the curate or the doctor, whose credit has been saved by the second class—must they "go third"? On the whole, officers are most exempt from the operation of such distressing doubts. It is no uncommon occurrence on the steps of the military Clubs for the buttons to arrest the progress of a passing omnibus, and for two liveried footmen to help into it the unwieldy form of General Sir Hercules Samson, K.C.B. Sir Hercules does not care who knows that his grateful country rewards the heroic actions of his youth with an annual sum about equal to that which he and his fellows at the Club pay their chief butler. But the difficulty of making distinctions of rank is in no way removed by his case. We shall always be puzzled by it, even though the railways throughout England adopt the new system of the Midland. The difficulty is illustrated by the perplexity of a man in the country who described a feat of shoplifting as having been performed by a lady. On its being objected that a lady could not have done such a thing, he answered conclusively, "Well, she was quite like a lady, for she had a parasol."

SHAKERS AND REVIVALISTS.

THE little community of Bible Christians, or Shakers, as they are more commonly called, which has for about a year and a half been one of the curiosities of the New Forest, and of which we lately gave some account, has just collapsed pretty much in the way that might have been expected. It was established on the strength of a small capital provided by a rich lady who had fallen under the influence of Mother Girling, the directing spirit of the movement, and by other adherents; and as long as the money lasted all went well. Unfortunately the funds of the community are now exhausted, and as the members are apparently either unable or unwilling to support themselves by their own industry, they are thrown upon the parish. There is nothing in this which need occasion surprise; but it is certainly strange to remark the disposition which is observable in some quarters to represent the evicted Shakers as the victims of persecution, and to justify their claim to be relieved from the ordinary obligations of honest folk. It is impossible, of course, not to be sorry for poor people—a large proportion of them women and children—who are suddenly turned out of doors in this bitter and inclement weather; but there is no reason why sympathy for the sufferers should take the form of indignation against those who have found themselves obliged to enforce their legal rights. That they were turned out at all was simply because they had voluntarily exposed themselves to this fate, and if they remained without shelter for a night it was because, in their fanaticism, they resolutely refused to accept any. It is perhaps characteristic of the philanthropy which compensates itself for an expansive love for one set of people by acrimony and injustice to others, that it should be hastily assumed that the Shakers have been ill used. Mr. Auberon Herbert, for instance, who tells us that he has been absent from Lymington for some time, and has no local information, nevertheless at once jumps to the conclusion that the magistrates must somehow have been behaving

badly, and that all Justices of the Peace ought therefore to be immediately abolished. In point of fact, the magistrates merely performed a legal duty. They could not refuse to inquire into the alleged insanity of Mrs. Girling; but, after examining her, they decided that her state of mind was not such as to justify her detention. Mr. Herbert also proposes to prosecute the medical man who in the first instance signed a certificate of lunacy; but there is no reason to suppose that the opinion was not given in perfect good faith. Mrs. Girling would certainly seem to be in some respects what most people would call crazy, although the magistrates were probably right in thinking that there were no sufficient grounds for shutting her up. As to the ejection of the Shakers, it appears that they had timely warning of the measures which were to be taken against them; but they did not choose to pay any attention to it. Theoretically the community was supposed to be complete in itself, and isolated from the rest of the world. But practically it had entered into relations with the world which entailed certain responsibilities. The estate on which it had settled down was mortgaged in order to provide money for current expenses; and there is no reason why Bible Christians should be exempted from the ordinary consequences of borrowing. If they were, it would probably lead to a large and sudden increase of their numbers. Having obtained the loan they required, Mrs. Girling and her friends appear, after the fashion of Mr. Micawber, to have considered the transaction at an end, and to have dismissed it from their minds. They took no thought of the morrow, or of the interest which would then fall due, and disregarded the legal notices which were served on them. It is all very well for pious people who have succeeded in obtaining an advance of money to shut their eyes to the existence of their creditors, but it is not unnatural that the latter should prefer to do business in the ordinary secular way.

It is possible that some new light may yet be thrown on the subject: but, as far as the information already published goes, it shows in the clearest possible manner that the Shakers have come to grief simply because they chose to incur liabilities which they had no means of meeting. There is a general concurrence of testimony that, notwithstanding their eccentricities, they are quiet, inoffensive people. They are very fond of preaching, singing, and dancing, and, for decency and convenience in the latter exercise, the women wear short skirts and trousers. In the excitement which followed the visit of the Sheriff's officers, one of the Shakers is said to have exclaimed, "They take my goods; they shall have my garments also," suiting the action to the word by stripping himself to perfect nudity; but there seems to have been nothing indecorous in the ordinary life of the community. If they could only have provided for their own subsistence without running into debt, there would have been no reason why any one should interfere with them, nor does it appear that there was any disposition to do so. The weak point of the project was that the Shakers lived on their capital instead of on the fruits of their industry, and of course when the former was exhausted they had nothing to fall back upon. It was no doubt intended that the community should be self-supporting, but its composition was by no means favourable to this result. Two classes came to it—those who had a little money to put into the common fund, in return for which they probably expected to be maintained without too much exertion on their part, and those who, having nothing whatever, thought they could not do better than take their chance of what was going. It has been asserted that some of the former vainly endeavoured to get their money back, and that others left because they could not endure the meagreness of the fare. As so much time was given to devotional exercises, including dancing, it may be inferred that the cultivation of the ground was not pursued with much assiduity, nor was any care taken in the admission of members to see that they were fit for their work. If they were sound in the spiritual sense, and believed fully in Mother Girling, that was enough. Mrs. Girling herself was originally a servant girl in Suffolk, and seems to be more remarkable for her fluency of speech than for her administrative capacity or knowledge of worldly affairs. Under these circumstances, it is not surprising that the establishment in the New Forest, however spiritually successful, should have proved an economical failure. The members were unable to raise sufficient food for their own subsistence, and it is said that for some time past raw carrots have formed a principal part of their dietary. The question has now come to be whether these fanatics, because they choose to disregard the ordinary conditions of social existence, are to be allowed to indulge their whims at the expense of other people. Those who profess to sympathize so keenly with the Shakers, and are so loud in exclaiming against the cruelty of making them pay the debts they have voluntarily incurred, have an excellent opportunity of putting themselves in the place of the creditors, and not only forgiving the actual debt, but providing for the future wants of the unfortunate enthusiasts. What has happened in this case is only what has happened in hundreds of other cases. The experiment is a very old one, and the same result has invariably attended it. Even in new countries where the communists have had all the advantages of ample space, primitive simplicity of manners, and freedom from the traditional prejudices and restrictions of an older society, their schemes have always ended in disaster, and always for the same reason—that a mode of life which requires the highest human perfection in order to do it justice is attempted by persons who are by no means perfect. Human passions and weaknesses break out, and spiritual elevation is found to be no protection against the consequences of personal imprudence and ill-regulated or neglected labour.

It may be thought that the world has been in existence during a sufficiently long period to enable those who live in it to form a tolerably accurate idea of the limits of human possibilities. Most reasonable persons have in fact come to the conclusion that more good is in the long run likely to be attained by avoiding too ambitious an estimate of what ordinary human nature is equal to, and being content to strive humbly and patiently towards the gradual realization of a higher ideal. The collapse of the Shakers in the New Forest curiously coincides with the movement of a new wave of religious sentiment which has already visited Scotland and Ireland, and is now expected to overflow England. Mother Girling's effort to restore mankind to a condition of primitive innocence, and the efforts of Messrs. Moody and Sankey to throw their audiences into paroxysms of religious emotion, bear a strong resemblance to each other, not, it is true, in their objects, for the American performers have nothing to do with any socialist projects, but in the means which they employ. They both desire to raise people to a state of mind and feeling which may perhaps be momentarily reached under the influence of spasmodic excitements, but which cannot permanently be maintained. What is aimed at is, in fact, a sort of artificial and hysterical exaltation, which is utterly inconsistent with sound health, and imposes a strain that necessarily produces a dangerous reaction. Mrs. Girling and her family preach, dance, and sing; Messrs. Moody and Sankey have not as yet taken to dancing. Mr. Moody endeavours to work upon the feelings of his audience by highly wrought dramatic narrative, acting, as it were, with voice and gesture, a series of little plays, and by sensational alternations from deep solemnity to vulgar humour. In order to rouse the audience, and get their nerves into proper trim, Mr. Sankey, a vocalist who performs in what is called "an effective manner," giving some lines *passionato* and others *forte*, sings a stirring melody; and then the whole body of people are set to sing together, raising of course a strong and thrilling body of sound. The dense crowding, the heat of the building, the physical effort and impression of the singing, naturally combine to produce a sort of hothouse effervescence, which Mr. Moody proceeds to intensify. His hearers are moved now to laughter and now to tears. In connexion with these services there is also a band of what are called "workers," who pounce upon persons in the audience, and carry them off to exhort and argue with them. There can be no doubt that exercises of this kind have a very powerful influence on many sensitive and weak-minded persons, and that an appearance of violent religious fervour is produced. A great many converts are said to be made, and we can readily believe it. It is, however, more to the purpose to ask how long these conversions usually last, and what is the subsequent condition of the converts. Nothing is easier than to throw a certain kind of people into hysterics, and the means employed are rather physical than moral. Every doctor knows the symptoms and the causes, and can tell of the perilous prostration and lassitude of the unhappy patients when the stimulant has either been withdrawn or has lost its power. No one can habitually indulge in this sort of intoxication, which is in fact akin to that of opium or liquor, without suffering a weakening of the moral fibre, and being liable to paralysis after a succession of debauches. The amusements of the Beecher and Tilton case convey a melancholy warning of the degrading tendencies of that sort of sensational Methodism which is prevalent in America, and which has occasionally sporadic outbreaks in our own country. There is nothing more injurious either to mind or morals than that sort of emotional excitement which plays upon the physical circulation and the nerves, and subjects the reason to the insidious influences of an inflamed and hysterical imagination. Morality, no less than religion, depends for its safety on a sober, humble, and well-balanced mind.

NO QUESTIONS ASKED.

RECENT advertisements which have appeared in several newspapers have directed attention to certain provisions of the criminal law, to which, in spirit, if not in letter, these advertisements seem to be opposed. Blackstone and other writers speak of the offence of "theft-bote," which is where the party robbed not only knows the felon, but also takes his goods again, or other amends, upon agreement not to prosecute. This is called compounding of felony, and formerly was held to make a man an accessory, but is now punished only with fine and imprisonment. This perversion of justice, says Blackstone, was liable in the Gothic Constitutions to severe and infamous punishment; and the Salic law "latroni eum similem habuit qui furtum celare vellet, et occulto sine judice compositionem ejus admittere." By a statute of Blackstone's time, which substantially exists now, even to advertise a reward for the return of things stolen, with no questions asked, or words to the same purport, subjects the advertiser and the printer to a forfeiture of 50*l.* each.

This law has been applied in several cases to persons who no doubt felt it to be inconvenient. The celebrated Jonathan Wild was hanged for the kindred offence of "taking a reward under pretence of helping the owner to his stolen goods." This contrivance, says Blackstone, was carried to a great length of villany in the beginning of the reign of George I.; the confederates of the felons thus disposing of stolen goods at a cheap rate to the owners themselves, and thereby stifling all further inquiry. Wild had under him a well-disciplined corps of thieves, who brought in all their spoils to him, and he

kept a sort of public office for restoring them to the owners at half-price. A statute was passed to prevent this practice, and, as Wild still continued it, he was convicted and executed upon this statute. He was first tried for stealing a parcel of lace from a shop, and the fact appearing to be that another man stole the lace, and Wild stood at a street corner and received it, he was acquitted. He was then indicted under this statute, and on proof that he received ten guineas from the shop mistress under pretence of helping her to her lace, he was at last convicted and executed. The pitcher went to the well once too often. Wild was the original of Peachum in the *Beggars' Opera*. This careful man of business keeps books in which the names and exploits of his heroes are entered, and a diamond ring or a gold snuff-box are as regularly posted to their several accounts as would be a bale of goods in a merchant's ledger. After his quarrel with Lockit has been appeased by his declaration "Brother, brother, we are both in the wrong," he hurries home, where he expects to see a gentleman about a snuff-box filched in the Park. The gentleman was no doubt prepared to pay handsomely and ask no questions.

An Irish case shows a curious example of tenant-right mitigated by horse-stealing. The prisoner had to pay a sum which he thought excessive on coming into a farm. The horse of the outgoing tenant had disappeared, and the prisoner caused him to be informed that, if he consented to pay a reasonable sum, three or four neighbours would exert themselves to find the horse; but if he refused, the horse would make a day's journey into the country. The prisoner was tried and convicted for the offence of taking a reward under pretence of helping the owner to his stolen goods. In an English case the house of the prosecutrix had been broken open and fourteen cheeses stolen. The prisoner, who was a tradesman employed by the prosecutrix, called upon her in the course of his business, and told her that he had some suspicion of the persons who had broken open her house. He proposed and executed a plan by which he brought to her house the persons whom he suspected of being concerned in the robbery. Upon the prosecutrix seeing them, she at once recognized them as persons who had been at her house on the day before the night of the robbery. The prisoner asked the prosecutrix if she did not think they were implicated in the robbery. She said she did, and he said he did also. She said, "I wish you'd try if you could buy a bit of cheese of them," to which the prisoner assented, and she gave him 3*l*. for that purpose. The prosecutrix was told several times afterwards by the prisoner that the cheese would come. She complained that he had got her money and did not mean to get her the cheese. He answered that she might have the money back whenever she pleased. The jury found that the prisoner knew the thieves, and assisted the prosecutrix as her agent and at her request in endeavouring to purchase the stolen property from them, not meaning to bring the thieves to justice. The Judge directed the jury to find the prisoner guilty. The case was considered by the Court for Crown Cases Reserved, and the Judges held that, upon the facts found by the jury, the receipt of the money by the prisoner was a corrupt receiving of such money within the statute. If the prosecutrix in this case, knowing, as she did, the thieves, had got her cheese back by the prisoner's assistance, it seems clear that she would have been guilty of compounding a felony, or "theft-bote."

An advertisement which appeared recently in the *Times*, states that a dressing-case, covered with leather, bearing certain initials with coronet, was "lost" from the outside of Paddington Station, at 6-25, on Saturday evening the 12th instant. As the case contained jewelry, &c., which cannot be replaced, 1,000*l*. will be paid on its restoration, with the contents untouched, to Messrs. Hunt and Roskell, "who are authorized to pay the reward." Assuming that this advertisement was issued with the consent of Messrs. Hunt and Roskell, we may ask what that firm would do if the dressing-case were brought to them with the contents untouched, and the reward were demanded. The advertisement states that the dressing-case was "lost," but those who issued it cannot be ignorant that it has been generally assumed, and is at least probable, that the dressing-case was stolen. Blackstone says that "theft-bote" is where the party robbed not only knows the felon, but also takes his goods again upon agreement not to prosecute. If Messrs. Hunt and Roskell are "authorized," as the advertisement states, "to pay the reward," they must be presumed to be authorized by the party robbed, and to be willing to put themselves in his place. If they received the jewels, they would know that they were receiving them from a person who could hardly by any stretch of charity be supposed to have come by them honestly. Even if it be possible that the person bringing the jewels could satisfactorily account for his possession of them, it is also possible that that person might give an unsatisfactory account or none at all. What would the firm be prepared to do in such a case? If they sanctioned the issue of the advertisement, they ought to be prepared to answer this question, which is very serious. They might perhaps say that the advertisement was only issued to decoy thieves within the grasp of justice. But it is certainly unusual for such a firm to go into the detective's line of business; and it may be doubted whether a jury would accept this explanation of the advertisement. The statement is that 1,000*l*. will be paid on restoration of the jewels. It is not stated that the reward will be paid "and no questions asked," nor are there any words to the same purport. Still, that which is not expressed may be implied, and a jury might possibly think that the advertisement must mean this or nothing. The case would be disagreeably similar to that of the woman who, knowing the

thieves who had stolen her cheeses, wished to get them back by paying money for them. Although cheese is different from chalk, and also from diamonds, the persons who issued this advertisement could scarcely suppose that the law would be different in application to "jewelry and gifts of various kinds which cannot be replaced." Is it supposed that modern civilization can supply an improved Peachum who receives gentlemen at home, or waits upon them by appointment, in reference to jewelry incapable of being replaced which has been lost at a railway station?

It appears that a notice has also been extensively placarded and otherwise circulated throughout London which deals rather more particularly with the same matter. Any one into whose hands the jewel-case that was lost at Paddington Station may have fallen is requested to put himself directly into communication with the Earl of Dudley, Dudley House, Park Lane, "with a positive assurance that the greatest confidence shall be observed, and that the party so communicating with him shall act to his own advantage." This notice is even more surprising than the other. We make no assumption as to the authorship of either. It will no doubt be explained in due time how these advertisements and handbills got into circulation. It is enough to say that any person who adopts this method of recovering "lost" property renders both himself and the printer of his notice liable to a penalty of 50*l*. To say that "the greatest confidence will be observed" must surely mean either that no questions will be asked, or that the answers to them will not be revealed; and to say that the party communicating with the loser "shall act to his own advantage" seems to mean, although the expression is rather obscure, that that party shall earn reward and shall not incur debarment. It is common that persons who have incurred serious "losses" of property are so distracted with grief or anger as to take illegal steps for its recovery. They do not know the law, and they do not stop to learn it. In a current story by Mr. Trollope a young lady elopes and reaches Liverpool on her way to New York, when she is threatened with arrest, and consents to return to London with a police-officer. She has taken for her expenses a cheque given by her father to her mother for house-keeping, and her father, who is influential and imperious, telegraphs to the police at Liverpool, and an officer is at the railway station prepared, if necessary, to arrest her on a charge of stealing this cheque. The father's real object is to prevent her departure for New York with her lover. This, it need not be said, is a very questionable step; but in a novel it may be assumed that rich and powerful persons may take liberties with the law which would not be permitted to ordinary mankind. But if a similar assumption were to be made in actual life it might entail disagreeable consequences.

We have dealt thus far with this matter without precise reference to the wording of Statutes. But any one who will read the Statute 24 and 25 Vict. c. 96, s. 102, will find that it seems very nearly applicable to the authors, whoever they may be, of the advertisements on which we have commented. By that section whosoever shall publicly advertise a reward for the return of any property whatsoever which shall have been stolen or lost, and shall in such advertisement use any words purporting that no questions will be asked, or shall make use of any words in any public advertisement purporting that a reward will be given or paid for any property which shall have been stolen or lost without seizing or making any inquiry after the person producing such property, or shall print or publish any such advertisement, shall forfeit the sum of 50*l*. for every such offence to any person who will sue for the same by action of debt to be recovered with full costs of suit.

COLONEL FREDERICK'S MARRIAGE.

THE story of Colonel Frederick's marriage with Martha Rigden would furnish useful matter for a novelist. This officer had been in the Guards, and, being obliged by pecuniary embarrassments to retire from that corps, he obtained a commission in the East India Company's service in 1776, and went to Bombay. He was employed during the next fifteen years in wars against the Mahrattas and Hyder Ali, which greater contemporaneous wars in Europe and America have thrown into undeserved obscurity. It is not the least proof of British energy that these distant wars were prosecuted with varying success at the very time that the combination of France and Spain with the revolted American colonies compelled this country to struggle for existence close at home. In 1781 a combined fleet commanded the Channel, and deliberated about attacking the British fleet in Torbay, while a Spanish fleet and army besieged Gibraltar, and Lord Cornwallis was compelled to surrender at York Town. But in the same year Sir Eyre Coote defeated Hyder Ali at Porto Novo, and thus dispelled the awe with which that chief had been regarded, and preserved possessions in India which soon grew to the dimensions of an Empire. It is recorded that Colonel Frederick served in the campaign of 1778-9 against the Mahrattas, which terminated in the disastrous engagement of Telikgaum. In 1791 Lord Cornwallis was Governor-General and Commander-in-Chief in India, and Tipoo had succeeded his father, Hyder Ali, as ruler of Mysore. The Mahrattas were now allied with the British, and their army co-operated with a British force advancing from Bombay to invade Tipoo's country; while the principal British army advanced with the same object from Madras. The Mahratta army undertook to besiege Barwar, and,

having little experience of such operations, it was assisted by a detachment of Europeans and Sepoys sent under Colonel Frederick from Bombay. A premature assault ended in a repulse, but after the fall of Bangalore the place surrendered. In the course of these operations Colonel Frederick died at Darwar on the 17th of March, 1791. Early in the next year Tipoo was besieged in Seringapatam, and was compelled to purchase peace by ceding territory. In 1799 Tipoo was encouraged by Bonaparte's invasion of Egypt to provoke another conflict with British power, in which he lost his throne and life.

Thus much may suffice by way of sketch of the great events in which Colonel Frederick bore an honourable part. His domestic history during the same years must now occupy our attention. He had married Martha Rigden, probably at Stalisfield, near Faversham, in 1773, and in 1776 she sailed with him to Bombay, where she remained until her husband's death in 1791. The fact of their marriage is tolerably well ascertained by the circumstance that the widow enjoyed a pension from the Clive Fund, and there are other corroborating circumstances, but no record of the marriage now exists. It appears, however, that the system of registering marriages established about twenty years before was administered with considerable laxity, and in one parish, and perhaps in more, the practice was to enter a number of marriages in the book simultaneously, although they had occurred at various times. The irregularities which had grown by the middle of the century to an intolerable scandal were not likely to be changed all at once into an orderly practice, such as in the lapse of another hundred years has been attained. The statistics of marriages are now carefully collected and compiled, and afford foundation for curious and sometimes absurd theories. But before the Marriage Act of 1753, clandestine and mock marriages were common, as appears by the dramatic literature of the period. It is not surprising that some of the relations of Colonel Frederick regarded his conduct as they would that of one of those dashing heroes of comedy whom in character he seems to have resembled. They knew there had been an elopement, and doubted whether there had been a marriage. Yet it appears that this spendthrift gallant not only married the girl whom he had fascinated, but behaved well to her after marriage—a matter on which the conduct of the heroes of comedy is left in convenient obscurity. One of the most brilliant of these heroes, Sir Harry Wildair, has indeed been made to exhibit himself both before and after marriage, and it is generally agreed that the second comedy in which he appears as a pattern of constancy is much less lively than the first in which he amply justifies his name. It is, however, possible that Farquhar drew from observation when he made his reformed rake declare that,

In spite of satire 'gainst a married life,
A man is truly blessed with such a wife;

and among his numerous military acquaintances he may have met a prototype of Colonel Frederick. The letters of that gentleman to his sister-in-law are good evidence of the reality both of his marriage, and of his affection for his wife. She is, he says, the idol of everybody at Bombay, "the more so because, I am sorry to say, sensible and well-behaved women in India are very scarce." This was in 1781, when India could not be reached without braving, in addition to the hardships of a long voyage, the danger of capture by the French. At that time the hopes of our ancient enemy were raised by the accumulating difficulties of England. An able commander, M. de Suffren, sailed with a fleet from France to that convenient base of operations, the Mauritius, whence he transported a military force, including a regiment of Kaffirs, to Pondicherry, and landed it, to co-operate with Hyder Ali. In proof of the magnitude and resolution of these efforts of the French in India, it may suffice to mention that Admiral Hughes fought five indecisive battles with M. de Suffren. And although French hostility could not defeat, it seriously checked, the growth of English power in the East. What would be our feelings now if the only road to India lay by the Cape of Good Hope, and the Mauritius, lying right in the track, was swarming with active privateers? Yet such were the conditions under which formerly we managed to transport, not only troops and stores, but women and children, to India. Engagements between the Company's trading ships and privateers or regular cruisers of the enemy were not uncommon, and on one memorable occasion the traders, having no convoy, forced themselves into line of battle and beat off a French squadron which had made sure of capturing them. All these traders were armed, and prepared to use their guns. Society was used to the dangers and losses of war, and was disposed to provide liberally for the wives and children of its victims. Thus we find that at Bombay, after Colonel Frederick's death, a subscription was raised for his wife, who was, as he says, the idol of the place, and she obtained from the Company the pension and other assistance which enabled her to bring up her family suitably to her husband's station. Her sons, as was natural, entered the military or naval service, in which two of them died, while a third, General Frederick, survived till recently, and was the father of the petitioner in the suit. But we can quite believe that French privateers at sea and Hyder Ali on land made "sensible and well-behaved women," unless they were remarkably courageous, rather shy of India in those years. It was no figure of speech to say that the battle of Porto Novo saved Madras, and often in these fights for existence the General had only a few hundreds of British troops at his command, while four months of dangerous voyage lay between him and the possibility of reinforcements.

This case is less interesting in its legal than in its social aspect.

Allowing that a marriage may be proved otherwise than by a register, there could hardly be better evidence after the lapse of a hundred years than was produced in this case. It deserves notice that there are no direct means provided by English law of trying the title to a baronetcy, and this can only be done by bringing an ejectment for land held under the same right as the disputed baronetcy, or by proceeding to obtain a declaration of legitimacy under a recent statute. This was the proceeding adopted in the present case; and as the marriage of Colonel Frederick with Martha Rigden has been established, it follows that the petitioner, as his grandson, is entitled to a baronetcy which was conferred on the Colonel's ancestor. There was some evidence against the claim, but the jury did not hesitate long over their verdict. It is true that for some time after the marriage some members of both families did not believe that it had taken place, and they expressed their disbelief in still extant documents. It was founded probably on an estimate of Colonel Frederick similar to that which a theatrical audience would form of Sir Harry Wildair. He would beyond doubt have seduced Angelica if he could, but, as he could not, he married her. When he found that he must choose between a duel and a wedding, he chose the latter. "Any man," he says, "dare fight; but I'll do more—I'll marry." The uncle of Martha Rigden used language which fully justifies our comparison of Colonel Frederick with Farquhar's lively hero. He tells his niece that he and others of her family think she is not married. "You left all your friends," says he, "and became a companion to one of the greatest rakes in the kingdom," who had almost ruined his father and contracted debts which forced him to fly the country. "By him you have had two children, which I am afraid are illegitimate." A memorandum exists in the handwriting of this uncle, apparently embodying the account which had reached him of the asserted marriage. The place and time are stated to be Stalisfield, March 1773; the clergyman who married her was gone to the East Indies, the man who gave her away was dead. The uncle's comment on this statement is "very bad account." But the statement is sufficiently credible, particularly as we are able to judge of the probability of Colonel Frederick's entering into a clandestine marriage by surveying the whole of his conduct both before and afterwards. The uncle was perhaps right in thinking that Colonel Frederick would not have married his niece if he could have helped it; but, between his own passion and the girl's firmness, we may assume that he could not help it. The uncle's letter, which is dated July 1, 1776, contains the words, "All this" (becoming companion to a rake and bearing children) "has been done in secret to us till a month ago." This tallies with the fact that the niece gave in her maiden name receipts to her uncle for moneys paid by him to her up to May 1776, and afterwards signed receipts "Martha Frederick." On the other hand, it appears that in a bond and deed executed by John Rigden, brother of Martha, in 1783, she was called Rigden. These documents were executed by John Rigden in order to obtain payment of a legacy due to his sister, of which she was much in want; and doubtless under these circumstances he would not be very particular what he signed. He survived his sister, who died in 1794, and after her death he disputed the fact of her marriage, and kept possession of a small estate to which his eldest nephew, if legitimate, would have been entitled. In a letter written in 1800, in which John Rigden stated his intention to hold the estate, he said that "this affair"—that is, the dispute about the marriage—would injure his deceased sister's children, "as the Company will of course take off the annuity." He seems to suggest that, if he is allowed quietly to hold the estate on the supposition that there was no marriage, the Company may be left to go on paying an annuity to the children on the supposition that there was a marriage. This is not very elevated morality, but he professes an intention to expend the income of the estate he was holding upon the family of his deceased sister; whereas, if he gave up the whole, that income would go to the eldest son exclusively. Much importance cannot be ascribed to any acts or declarations of John Rigden, and, on the other hand, it is nearly certain that a certificate of the marriage must have been produced to the Company to obtain the pensions which were granted to Colonel Frederick's widow and children. John Rigden must have known that such a certificate was necessary, and, if he believed that no marriage had taken place, he must have believed that his sister's income had been obtained by forgery. On the whole it is impossible to attach much weight to the evidence against this marriage, and the supposition that an irregular marriage took place harmonizes with the undoubted facts of the case.

REVIEWS.

MAYNIER'S COUNCIL OF TRENT.

THE genuine history of the Council of Trent has yet to be written, and whether it ever will be written must remain a question for the present. It is not only that historians, and especially ecclesiastical historians, are very apt to be partisans. Such was indeed the case with the first two writers on the Council, of whose works all later records are little else than transcripts or abridgments. Sarpi, who had long been suspected

* *Étude historique sur le Concile de Trente.* Par L. Maynier. Première Partie, 1545-1562. Paris: Didier et Co 1874.

of secret Protestantism, is proved by recent investigations to have been in fact a secret unbeliever; the Jesuit Pallavicini, who, unlike Sarpi, had access to the original sources, held a brief for the Pope, and was rewarded with a Cardinal's hat. The able and learned writer who has adopted the *nom de plume* of Maynier is perfectly correct in saying that "whoever undertakes to write a history of the Council will be obliged to begin the whole work *de novo*"; and he will also be obliged to wait till the Acts of the Council, which to this day have never been published, as well as the voluminous correspondence about it, hitherto jealously guarded in the archives of the Vatican Library, are placed at his disposal. Some light will no doubt be thrown on the subject in the posthumous edition, announced to appear shortly, of works prepared for publication by the late Father Theiner, who did not live to see them through the press. Theiner was for several years Keeper of the Vatican archives, and was only deprived of his office during the recent Council in consequence of his having shown the order of business of the Council of Trent to the German Bishops, who were thus led to protest against the very different *regolamento* enforced by Papal authority at the Vatican Council. Cardoni succeeded him, but the Jesuit Piccirillo, the Pope's confessor, received the permission, never before granted to any one, of going alone, whenever he chose, into the secret manuscript departments of the Library, and it is feared that valuable documents may be removed or made away with before there is any chance of their coming into profane hands. A distinguished English Roman Catholic, who at one time had access to the archives, is also said to be preparing a work on the Council of Trent, and we sincerely trust the report may turn out to be well founded. Meanwhile nothing like a complete history can be looked for, until, if ever, the entire treasure of original records is made available for the use of competent scholars. The present writer is too well aware of this to profess to supply a *lacuna* for which adequate materials are not at hand. His work is based on Pallavicini, corrected by an examination of recent German critics, and of important documents discovered in the Simancas Archives. He evidently anticipated Ultramontane hostility, and is careful to insist that the work, which is written from a strictly Catholic standpoint, is intended to serve the cause of the Church, which "is not aided, but dishonoured, by the use of lies and reticences." His estimate of the subject is defined in the following passage:—

C'est précisément à un de ces moments critiques de la vie des peuples, celui où l'organisation féodale en décomposition s'effaçait devant la société moderne, prête à prendre sa place, que le concile de Trente s'est réuni. Cette époque, ainsi que toutes les périodes de transition, étant moralement inférieure à celle qui a précédé, comme à celle qui a suivi; elle fait tache entre le treizième et le dix-septième siècle. L'Église très-malade au huitième et au neuvième siècle, après s'être relevée par la réforme de Grégoire VII, souffrait depuis Boniface VIII, et surtout depuis la translation du saint-siège à Avignon, de maux assez graves pour amener la perte de toute institution purement humaine. Si le protestantisme est essentiellement une fausse conception théologique, fruit des scrupules orgueilleux d'un moine sans vocation, on ne saurait nier que le besoin universellement senti d'une réformation pouvait seul rendre populaire une théorie aussi abstraite que celle de la justification luthérienne. Toute réticence au sujet des abus enracinés dans le gouvernement ecclésiastique au seizième siècle risque de provoquer de trop faciles réminiscences.

In an interesting introduction of 160 pages the author sketches the condition of the Church, and the causes and growth of the Protestant Reformation, previously to the Council of Trent. One main source of corruption is traced to the episcopate, which, a hundred years after the Council of Constance, was still immersed in the disorders which it had been one of the main objects of that reforming synod to cure, and we are reminded, justly enough, that history reveals a continual connexion between the greatness and decline of the Church and of the episcopal order. These corruptions were due partly to improper elections, especially to those sees, such as many in Germany, whose excessive wealth and civil prerogatives made them objects of temporal ambition; partly to the constant and vexatious interference with diocesan jurisdiction by the Court of Rome, through exemptions, immunities granted to religious orders, and the like. The interecine struggle, carried on for nearly half a century with the aid of every available weapon, moral or material, between the rival forces of the Reformation and the Catholic reaction, and issuing in the decrees of Trent and the definite separation of Western Christendom into two opposite camps, is of course familiar to all readers of Ranke. But they will derive both interest and instruction from the vivid presentation of the period set before them from a somewhat different point of view in these pages. Some notion may be formed of the state of the monastic bodies, which Protestant writers have often been accused of libelling, when we find a select Committee of Cardinals, including Pole and Contarini, appointed by Paul III. in 1537 to report on the reform of the Church, recommending their gradual but entire suppression, by forbidding them to receive any fresh novices. In Germany, partly through the neglect of the bishops and partly through the rapid spread of Protestantism, the Legate Contarini found more than fifteen hundred cures deprived of pastors. Nevertheless it was not till every method of delay and subterfuge had been exhausted that the Holy See at last reluctantly yielded to the urgent demands which had been pressed on its notice for a quarter of a century by the Catholic sovereigns of Europe, for the convocation of a General Council. And when the Bull convoking it had eventually been issued in 1542, three years had still to elapse before the Council actually met. Some few bishops did indeed assemble at Trent in November 1542, but so few that the Legates declined to open the Council;

and the Protestant princes announced their refusal to recognise an assembly composed of creatures of the Pope. This was a point of critical importance, for we must remember that the great schism was not as yet accepted on either side as an accomplished fact. The old cry, which had been heard so often during the fifteenth century, for a reform of the Church in her head and in her members, was still the watchword alike of princes and peoples. The Catholic Church was regarded, not as an edifice to be destroyed, but to be restored on its old foundations; and even Luther professed to be only vindicating the ancient and forgotten Catholic doctrine, not inventing any new creed of his own. All the diets and religious conferences of which so many were held during the twenty years preceding the Tridentine Council started with the assumption that Catholics and Lutherans, however widely diverging in opinions, were members of the one sole Universal Church, between whom therefore a reconciliation might be, and ought to be, effected. It was not till towards the close of the Council of Trent that a different view began generally to prevail. And meanwhile within the bosom of Catholicism two rising parties, which may be respectively designated the Reforming and the Jesuit, were contending for the mastery, like the unborn children in Rebecca's womb. Our author shall describe them:—

Du temps de Luther et de Charles-Quint, il y avait dans le sein de l'Église catholique un nombre considérable d'hommes de science qui, tout en demeurant attachés à l'ancienne doctrine et à l'unité, réclamaient des réformes étendues, un retour aux anciennes institutions de la discipline ecclésiastique, et se montraient prêts, par conséquent, à faire aux luthériens de larges concessions. Suivant eux, il fallait rechercher les opinions et les jugements portés dans l'Église primitive afin de refaire autant que possible l'Église contemporaine à son usage et ressemblance, en cherchant à se rapprocher des institutions et de la forme de gouvernement qu'elle avait eues après Constantin. À côté de ce parti, toutefois, il en existait un autre que la force des choses et les besoins de la lutte contre le mouvement allaient rendre prépondérant. Ceux qui le composaient ne prétendaient point remonter aux temps apostoliques, mais exagéraient au contraire les traditions du moyen âge. L'Église est, disaient-ils, une monarchie universelle, gouvernée par un chef omnipotent, à qui toute créature est soumise, vis-à-vis de laquelle personne n'a de droits, et de qui émane toute autorité, même séculière. Cette monarchie ayant besoin, tout autant que les autres, de force, pour faire exécuter ses arrêts, et d'argent pour se soutenir, jouit du pouvoir coactif le plus étendu soit qu'elle l'exerce par elle-même, soit qu'elle oblige le bras séculier à lui prêter ses services, et doit s'appuyer à toutes les mesures tendant à amoindrir les grands revenus qui lui sont nécessaires pour faire face aux énormes dépenses qu'exigent les détails du gouvernement de toute la catholicité. Dans ce système, ce serait provoquer la rébellion que de faire une concession quelconque à des séculiers et à des hommes en état de révolte contre l'autorité.

The Council of Trent was in session nominally for eighteen years, from 1545 to 1563; but during half that time, from 1542 to 1564, it was actually, and during about half the remainder virtually, suspended. The volume now before us deals with the earlier period of the Council, up to its suspension by Julius III. in 1552, comprising the principal doctrinal decrees, and especially the famous chapters on Justification, which the author calls "the decisive act and eternal honour of the Fathers." When the Synod was at length opened, on the Third Sunday in Advent, 1545, it came "too late for the Protestants already confirmed in their errors, and too late for the Catholics, who, after these long delays, had lost all confidence in the good faith of the Popes and the sincerity of the professed intention to reform the Church." Two years accordingly were chiefly absorbed in the disputes of rival potentates, Charles V. and Francis I. being jealous of each other and equally jealous of the Pope. In 1547 Paul III., who was alarmed at the growing power of the Emperor, transferred the Council from Trent to Bologna, a city within his own dominions, to the great indignation of Charles, who forbade his Bishops to leave Trent, and the deliberations were practically suspended for about four years. On the other hand, Henry II. of France, whose name had been passed over in the Bull of resumption, resented the recall of the Council to Trent in 1551 at the request of the German Emperor, and refused to acknowledge its Ecumenical character, or to allow his Bishops to take any part in the proceedings. The French Church therefore had no share in the discussions which resulted in the Tridentine definitions of the doctrine of the Eucharist. For the perpetual bickerings of adverse theological and national parties within the Council itself, the jealous rivalries between the Papal Legates and the Bishops, German and French prelates, Spaniards and Italians, we must refer our readers to the interesting narrative here given. One point, however, deserves special notice, the more so as the astounding assertion was made not long ago on high authority that Papal infallibility was just as much an article of faith before the Vatican Council, and had only not been defined because since the rise of the Gallican heresy in 1682 no General Council had assembled to condemn it. Not to dwell here on the notorious fact that Gallicanism did not take its rise in 1682, but at least three centuries earlier, during which period two Ecumenical Councils had not only not condemned, but expressly sanctioned, its leading principle of the supremacy of Councils over Popes even in matters of faith, it is important to remember that the Gallican doctrine was prominently brought under the notice of the Tridentine Fathers, who did not indeed venture to renew the decrees of Constance and Basle in its favour—for the Protestant revolt was already producing its natural fruit in Papal reaction within the narrowed circle of the Roman obedience—but did resolutely refuse to condemn it. The Legates took occasion from the definitions of the sacrament of order to introduce an article asserting the superiority of Popes over Councils, and even had the hardihood to charge those bishops who denied it

with heresy. But this article, as well as another which seemed to derogate from the divine authority of the episcopate, had to be withdrawn.

On April 28, 1552, the Council was prorogued for two years by direction of Julius III., but it did not in fact reassemble for nine years. The results it had achieved, and failed to achieve, up to that point are summed up in the following passage, with which our present notice must conclude. We shall look with much interest for the second volume relating to the subsequent period of the Council:—

Prorogé soi-même pour deux années, le concile se trouvait effectivement dissous comme l'avaient prédit les évêques espagnols; et disparaissait dans la tempête, sans que la chrétienté, sous le coup des inquiétudes causées par le renouvellement de la lutte entre la France et la maison d'Autriche, accordât beaucoup d'attention à cet événement, car bien des circonstances défavorables s'étaient réunies pour empêcher cette assemblée éphémère, dont la durée n'avait guère dépassé six mois, de répondre aux espérances conçues à son sujet. Le trop petit nombre des évêques présents à Trente, le vide laissé par l'Eglise de France, l'indifférence des prélats allemands, les manières impérieuses du légat, trop assuré de ne rencontrer qu'une résistance timide chez l'Empereur, décidé par scrupule et par intérêt à ne pas rompre avec Jules III., vis-à-vis duquel il avait d'ailleurs pris des engagements au moment de la réouverture du concile, tout avait contribué à faire de cette seconde période de l'assemblée une grande chose manquée. Sans doute la promulgation du décret sur la justification, l'acte décisif des Pères de Trente et leur éternel honneur, avait presque achevé l'œuvre des théologiens, et il ne restait plus en 1552 qu'à délimiter des questions de détail, mais l'œuvre de la réforme, à peine entamée, ouvrait au zèle des évêques une ample carrière où ils mettaient à pleine loie. Tous les essais tentés dans le concile échouaient successivement. Ainsi le légat n'arrivait pas, comme il l'avait désiré, à répondre aux attaques des protestants contre l'autorité du souverain pontife, par des déclarations amplifiant cette autorité; les évêques ne parvenaient point à opérer les sérieuses réformes, si vivement souhaitées par eux. Enfin, les espérances de conciliation qu'avaient fait naître l'acceptation du concile par la diète et la présence à Trente des théologiens et des ambassadeurs luthériens, aboutissaient à une rupture définitive entre les deux croyances, à la surprise d'Imhoff, à la fuite de l'Empereur et à des hostilités, qui, après avoir anéanti tous les résultats de la bataille de Mühlberg, menaient le trépas de Passau, et, comme dernière conséquence, l'abdication de Charles-Quint.

SPORT IN INDIA.*

THE publication of these sporting adventures reminds us that not only are there many varieties of birds and beasts to test the skill and endurance of residents in India, but that there are also divers approved modes of slaying them. We now know of three or four ways in which the tiger may be killed. The Chief Commissioner of Oudh, and the Maharaja of Nepal, each take the field in the months of February or March, and, with a majestic line of some thirty elephants, sweep through the long grass or the heavy tree jungles that border their respective dominions. On the extreme left and right, and at different intervals in the line, experienced shots wield all the improved machinery of modern warfare. Between the elephants, which carry howdahs and shooters, are two or three animals smaller in bulk, or not possessed of the steadiness of Peary the staunch female, or Hyder Ali with his formidable tusks. The array moves forward, stops, and wheels at the bidding of the commanding officer. Shooting at peacocks, deer, and even buffaloes, however tempting, is strictly forbidden when there is the least chance of starting a tiger; and though, in many instances, this animal sneaks off and is rolled over, like a hare in a battue, without showing fight, sometimes an angry and surprised beast, with lashing tail and open jaws, roars defiance at the whole body, and contrives to fix his claws on the trunk and head of some one elephant, in spite of a shower of bullets. This is the very epic poetry of Indian *Shikar*. Then a single and determined sportsman has been known to conceal himself in a tub, or to seek the shelter of the lower branches of a large tree, and to watch during the long and still hours of an Indian night, until the destroyer returns to feast on the bullock of which he had broken the neck the afternoon before. A third sportsman, backed by a trustworthy companion, or even by a steady native attendant who carries a spare gun, thinks himself a match for the jungle monarch on foot; arguing that, to a practised eye and a cool hand, four barrels are sufficient to stop any charge. A fourth description of tiger-hunting is given in the volume before us. Platforms are quietly run up in selected spots in the jungles, at an elevation sufficient, under all ordinary contingencies, to secure the safety of their occupants. Seated on these *machinans*, as they are termed in native parlance, the shooters await the arrival of the game, which is driven to them by a long line of beaters. In fact, the tigers, with bear, deer, hyenas, and winged game of several kinds, are compelled to take a certain direction, like grouse and black-game on a Yorkshire or Lowland moor. In the first and the last of these descriptions of sport the danger is generally reduced to a minimum. An ingenious calculator has reckoned that, for every ten tigers put up by a line of elephants, nine try to get away for one that charges; that of every ten that may charge, nine are stopped before they can fasten on any single elephant; and that out of ten that are so missed and make good their attack, only one seriously hurts either the mahout or the occupant of the howdah, or inflicts a grievous or deadly wound on the elephant. Little or nothing can be said in favour of following tigers on foot, though there is something to be said for men who sit up listening for

the feline footfall or the crunching of bullock's bones on a moonlight night. Now and then a manslayer, the terror of half a district, can be got at only through audacity combined with strategem; and readers of Captain Shakespeare's adventures may recollect how on one occasion he was induced to assume the habit and discharge the functions of a postal runner, in order to rid the country of a certain man-eating tiger, which at the least trump of an elephant or the first shout of a beater would have made its escape to the other side of the country. But, as a general rule, it may be said that those who shoot tigers, except from the backs of elephants or from airy platforms, sooner or later get clawed or killed for their pains. The author of this work justly characterizes these practices as foolhardy.

We have made these remarks after a perusal of this book, which is a very faithful and accurate description of a well-ordered hunting party on a large scale, in which, as far as we can make out, there was not an elephant employed in the camp, except to carry the baggage. The author tells us that he served for some years in the department of Inland Customs, the officials of which, besides other duties, are required to collect the duty on imported salt and cotton, and to prevent altogether the importation of sugar into the North-West Provinces. As smugglers usually take to bypaths instead of highways, it follows naturally that officers of the Preventive establishment must spend much of their time in lonely and isolated stations, and manage to acquire a thorough familiarity with the habits of jungly tribes and savage beasts. There can be no doubt that an active and intelligent official who has varied the duties of hunting down pack bullocks, and pouncing on suspicious articles snugly stored in innocent conveyances, by using the rifle, the smoothbore, and the hog-spear, must have accumulated a store of anecdotes worth telling. And we can take no exception to this book on the ground that the facts are stale or the knowledge of woodcraft superficial. Unfortunately, the author was not content with penning and publishing the record of a delightful cold-weather hunting trip, in a plain and straightforward way. But he has thought it necessary to vary the monotony of sport by Eastern apoloques and native tales. In most instances the author preaches, while his companions, who are, of course, Brown, Jones, Smith, and Robinson, listen with applause and bewilderment. He tells us indeed in his opening chapter that a division of labour in such expeditions is conducive to mutual comfort, and that one man should look after the horses, canals, and ponies, another the wines and stores, a third the erection and despatch of the tents, whilst a fourth should be paymaster. This is all very true, but the author's language and tone throughout the book is that of a dictator who arranges everything for everybody. He is both president and caterer. Not only does he cut out the work of every day, post the shooters, despatch the beaters, forbid a shot to be fired at a deer when the party are expecting a tiger, and order the tents to be struck; but he takes care that his companions shall all retire to bed in good time, and he watches over their habits with the vigilance which the stroke-oar of the Trinity boat is popularly supposed to exercise over the morals and manners of his crew. This might be pardoned, though it is a singular corollary to what we were told at the outset regarding the division of labour. But whenever the sportsmen ask any question or venture any remark, the inexorable president is down upon the speaker with an overwhelming avalanche of knowledge; and when, after two or three days' consecutive hard work in the jungle, the tired hunters have washed and oiled their guns, and are in the humour for a short stroll and an early dinner, the same unwearied instructor insists on their listening to a long-winded story about a jackal and an alligator, or to nearly fifty lines of blank verse on the subject of "Prudence counselling youth." Interspersed with sage advice and remonstrance we find scraps of poetry, "The Toper's Lament," "The Stricken Deer," "The Wild Ducks, a fable," of which the following specimens may suffice. A sportsman startles a flock of ducks from behind an ant-hill, which in India is thrown up to a size that may lend colour to the stories of Herodotus, and then fires:—

His aim was sure, and two birds lay
('Twins sitting shot he took);
As the flock fled in haste away
Two more he brought to book.

It would surely have been equally correct, and not much more prosaic, to say that the successful stalker "potted" a couple with his right barrel as the ducks lay on the water, and secured a couple more with his left as they rose. A deer is hit by a ball, and sings, like the dying swan:—

I instant felt a dreadful pain,
His cruel ball had oped my side;
Madly I bounded o'er the plain,
In thicket's shade methought to hide.

We own that, though there are few things more enjoyable than an expedition under canvas, during the Indian winter, through a district abounding in game and in picturesque views of wooded hills and clear streams, while official or social worries have been left behind, the enjoyment might be bought somewhat dear if we were obliged to listen to indifferent rhyming or to the moral of a lengthy debate by the "General Parliament of beasts." It may indeed be urged, as is intimated, that these edifying harangues were not really delivered as they are printed, but that the speakers are imaginary, though the incidents are true, and that they have been interwoven with the sporting narrative in order to get rid of the writer's immense stock of experience. If so, all we can say is that we prefer a plain tale showing what kind of country was traversed, how the

* *Past Days in India; or, Sporting Reminiscences of the Valley of the Soane and the Basin of Singrowlee.* By a late Customs' Officer, N. W. Provinces, India. London: Chapman & Hall. 1874.

servants were detected in cheating, how well the native trackers understood their business, and what was the total bag. Nor are anecdotes of cunning wild beasts outwitted by men as wild, or striking facts in natural history, out of place in such a work. But the author is not always happy in the arrangement of his materials, and the style is not quite up to the mark of Indian official writing. The attitude of the president, we are compelled to say, whether to Brown and Jones, or to the reader, rather reminds us of Mr. Barlow in *Sandford and Merton*, or of the tutor in *Eyes and No Eyes*, in the now forgotten boys' book of *Evenings at Home*.

Still there is a good deal that is not commonplace. The line of country has not been worked out by others. The sportsmen went over the tablelands of the Kymore range, down to the valley of the upper part of the Sone river, and along the hollow or basin of the native State of Singwalee. They started from, and returned to, the station of Chunar, where a celebrated fort, rich in the memories of halled conspirators and political traitors, looks down on the passenger by the East Indian Railway. Like most Indian sportsmen, the author carried with him the groceries and the apothecaries. Unknown indeed to Anglo-Indians in the plains are the discomforts and hardships undergone by those who camp out on the lone prairies of the Far West. No shivering before log fires or crouching under butts hastily formed of bark or branches. No short commons on the ancient buffalo and the superannuated wild turkey. The tents were always ready. The dinner of three courses rarely failed. The cold bath, with which the Anglo-Indian begins the day like the old Roman, was found in some clear river or was prepared for the hunters in their bathing tents. No one appears to have lacked his fair share of the equal feast of venison soup, followed by venison cutlets, and varied by fresh *Mahseer* fish, juicy hump, and quail or partridge. Nothing, as those who have tried camp life in India know, can exceed the readiness, the endurance, and the ingenuity of native servants on such occasions. Fire-places and cooling-ranges are extemporised before the tents are pitched, at every halting-place, by means of a spade and a few bricks. The tablecloth is laid with a neatness and precision which would almost satisfy the wife of a Chief Commissioner about to give a large dinner to the residents of the station at Christmas. The worst that can happen on such well-named expeditions is that the wine and beer may run short if not carefully looked to, or that two or three coolies may bolt because a portly native butler has attempted to levy an undue percentage on their wages. The volume before us shows that all such contingencies were properly anticipated, and that the administrative skill of which Indian officials have lately given such signal proof on an enormous scale rarely failed either to provide a liberal table or to secure a reasonable amount of sport. Let it not be imagined, however, that the amusement expended was anything extraordinary. In all probability the cartridges fired in one week at small game, by the whole party, would be exceeded by two shooters during three hours on the Scotch moors on the 12th or 13th of August, or in twenty minutes in a battue in the Eastern Counties. Deficiency in slaughter was, to our thinking, fully compensated by variety. In a morning stroll the sportsmen could generally reckon on bagging some peacocks, a few ducks and teal, quail, a hare or two, and four or five brace of black and grey partridges. Occasionally, a spotted deer sprang from a bush as they walked on, and was knocked over; and one of the party seems to have had an extraordinary fondness for what Anglo-Indians term Brahminy ducks, but which is known to natives as the Chukwa Chukwi, or in Sanskrit as Chakravaka. These birds go in pairs at almost all seasons of the year, and not in flocks, and their cries and supposed loves are amongst the commonplaces of Hindu poets. To naturalists the bird is known as the Ruddy goose, or *Anas caracca*. But it must have taken a good deal of the enterer's skill to convert this rank and oily water-fowl into a palatable stew. On one or two occasions they varied the walk in line, together with its file-firing, by ringing antelopes. As this kind of deer is usually found on the open plains and near patches of cultivation, it is as wary as the red deer of the Highlands. But the horsemen divided themselves into small parties, and rode "at a slow and lordly pace" in a circle round the herd, gradually reducing the space between the antelopes and themselves, and getting several shots as the bucks at last broke away. Another mode of getting a shot was to stalk the animals under cover of a couple of bullocks, much on the principle by which grouse are "carted" in parts of Northumberland; and a third plan, very much practised by natives, and slightly allied to pot-hunting, was to creep up to the herd under shelter of a moveable screen of leafy branches. But the cream of the sport was, as we showed at first, the great drive, when a line of beaters swept the jungle, and the hunters sat expectant on the platforms. Some persons may think it tame sport to shoot tigers in this way as they sneak past like beaten dogs. But where the ground is unfavourable for the manoeuvres of elephants, or where these animals cannot be collected in sufficient numbers, it is perfectly legitimate, and there is something inexpressibly exciting in a grand "chukwa." In the first place, to post the sportsmen and to marshal the line of beaters requires no slight skill; and when the guns are all in position, the excitement is gradually fed by the increasing shouts of the advancing army, and only reaches its highest pitch when, after the meagre or inferior animals have gone by, the nose of a bear or the stripes of a tiger are seen to reward the patience of the sitters.

Despite a want of point in some of the stories, and disquisitions which might have been curtailed, the book con-

tains many illustrations of native life and character and incident which only a veteran could have collated. Of this kind are the descriptions of the mounds of earth raised over the spot where a man has been killed by a tiger, to touch which is as great a sacrilege as it was for a Roman to remove the *triste bidental*; the death of two tigers, one of which killed and half ate up an unhappy wood-cutter, while the other had actually carried off a young bride from the centre of a marriage procession; of the wild cat, "mad with wounds," which, like Horatius in the Lays, flew right at the face of Smith; of a dog named Bruno that fairly vanquished a wolf in single combat, while the owners, in a spirit of equity, looked on, but refused to interfere; of the walking fish, the fins of which are so constituted that by them it can make an overland passage from one pond to another; of the Dhauangs, a jungle tribe, who used the axe to brain the bear, strung a bow which defied the efforts of an Englishman, and sent their arrows through the vitals of a deer; of the cleverness of two natives who drove off a pack of hungry wolves by the expedient of trailing a long cloth, serpent fashion, on the ground; and, finally, of two tigers, one of which was baffled by the cool determination of an unarmed Englishman, while the other was intimidated by a brave native lad, who faced the animal while his seniors ran off, and of whom we can well believe that "he lives in native clover, doing what he likes with every one, and he would be a very daring man who lifted his hand to hurt him." For the details of the above incidents we refer readers to the book, and we can fairly recommend it, not only to Anglo-Indians for its memories and associations, but to intending tourists who wish to refresh themselves by sport in a country where a premium is still put on the heads of destructive wild beasts, and where game birds are fast diminishing and disappearing because moderate protective laws are unknown.

HOPE'S WORSHIP IN THE CHURCH OF ENGLAND.*

(Second Notice.)

WE resume our review of this book at the place at which the writer addresses himself to the task of proving, in contravention of the judgment of the Judicial Committee of the Privy Council in the undefended case of *Hebbert v. Purchas*, that the Ornaments Rubric of the Prayer-Book, as re-enacted in 1662, gives legal sanction to the use in the present Church of England of the distinctive Eucharistic vestments enumerated in the First Prayer-Book of Edward VI. That judgment maintained the extraordinary position that the Rubric of 1662, which has statutory authority, is to be interpreted by the Canons of 1604, which had no such authority, rather than by the Rubric of 1549, to the Parliamentary authority of which it expressly refers. The plain answer to this is, that if the revisers of 1662 meant this, it was easy enough to have said it. Why, in the name of common sense, should they have rehabilitated the Rubric of 1549 in so many words, if they merely meant to confirm the Canons of 1604? There cannot, we think, be much doubt that, upon a new hearing of the points of dispute, the judgment in *Hebbert v. Purchas* will be reversed, and the legality of the Edwardian vestments—we say nothing of the expediency of using them, even if they should be proved to be legal—reasserted, in harmony with a previous decision of the same tribunal. The fact that the requirements of the Canons of 1604 differ so materially from the enactments of 1662 is not puzzling, if it is once perceived that the former prescribe the practical minimum, and the latter the theoretical maximum, of legal ceremonial. Mr. Bressford Hope shows incontrovertibly that this is the case. Indeed he proves, by a comparison of the Latin form of the Canons—which is of equal authority with the English form, but with which the judges in *Hebbert v. Purchas* seem to have been unacquainted—that the immediate object of the Twenty-fourth and Twenty-fifth Canons was not so much to prescribe the dress of the celebrant as to define who was to be celebrant in cathedral or collegiate churches on the highest festivals. Anyhow, as our author emphatically points out, there is no escape from the dilemma that, whether the vestments of 1549 or the cope of 1604 be re-enacted by the Rubric of 1662—according to the earlier or the later judgment of the same Court of Appeal—a distinctive Eucharistic dress of some kind is, *ex confesso*, authoritatively prescribed by the Church of England. It follows of course that vestments which a bishop or dean *must* wear at Holy Communion in cathedrals cannot be, to say the least, essentially superstitious if worn by a poor parish priest at his humble altar. It also follows that no conceivable example of "lawlessness" could be more flagrant than that of prelates who, themselves (as assessors) declaring the law of the Church of England thus to prescribe Eucharistic vestments of some sort or other, and imposing such heavy costs on poor silly Mr. Purchas as hurried him to his grave (as many think) for misunderstanding that law before they had so defined it, yet have not personally obeyed, since their own judgment, the very law which they so harshly enforced against their luckless victim.

We pass on to a very important contribution to this discussion in the evidence adduced by Mr. Hope, from the charges brought against some of the Chapter of Durham by Peter Smart in 1630, that Cosin and others were in the habit of using copes "when the first part of the Communion Service was read," according to the

* *Worship in the Church of England*. By A. J. B. Bressford Hope, M.P., Author of "The English Cathedral of the Nineteenth Century." London: John Murray. 1874.

second of the two Ornaments Rubrics of 1549, and *not* surplices only, according to the Advertisements and Canons. This scurrilous paper by Smart was first printed by the Rev. G. Ormsby in 1869, in the first volume of Bishop Cosin's Correspondence, edited by him for the Surtees Society. Mr. Hope truly remarks that, if there was to be no Communion at "that empty shadow of a reality, the truncated Communion Office—so unhappily introduced in the Book of 1549," Hunt and Cosin were less ritually correct in wearing copes than Smart was in rejecting them. But

The question is as to what state of the law this action of theirs bears witness. If the Advertisements and Canons had superseded these Ornaments Rubrics, then Smart would have been right in his view of the law, and the remaining Chapter would have committed an illegality. If, on the contrary, they were sustained in what they did—and they were sustained—then we have got a direct conclusion, many years after the Canons, as to the dress of the minister, contained in the Prayer-Book of 1549, being held to be still in full force as against them, and so the reasonings of the Purchas Judgment are shown to be fallacious.

Those reasonings are also shown to be fallacious as regards the restriction of copes, according to the supposed meaning of Canon XXIV., to cathedrals; for Burgoyne—one of the accused—wore his cope in Warrmouth parish church and Cosin at Brancepeth. Equally important and novel is Mr. Hope's extract of a description of the ceremonial keeping of Easter in 1593 by Queen Elizabeth in her private chapel. This curious document was first printed in 1872 by Dr. Rimbault in his edition of *The Old Cheque Book of the Chapel Royal*, one of the Camden Society's publications. It appears that on this occasion the Bishop of Worcester, as celebrant, and the Sub-Dean, and the "Epistler," all wore copes. But this was twenty-eight years after those Advertisements of Elizabeth, which are supposed by some to have forbidden vestments. We quite agree with our author that the question whether these Advertisements ever received the royal signature at all is a matter of purely antiquarian interest to us after the settlement of 1662. Nevertheless he has given excellent reasons for doubting more than ever whether the Queen's sanction was ever given to them. But if the use of Eucharistic vestments was thus legal, why, it has often been asked, did the Bishops in their Visitation Articles enforce nothing more than a surplice? Mr. Hope replies that the Bishops were satisfied with the *minimum*—which was more than in those bad days could be always insisted upon—and, besides, they were careful not to impose upon the parishioners the burden of providing and renewing more costly vestments. This we believe to be strictly true. The Visitation Articles of our own days in like manner never inquire about anything beyond the merest essentials; and, as is worth noticing, are not, to our knowledge, altered in any respect since the abolition of Church-rates has really changed the whole position of affairs. We may add another confirmation to Mr. Hope's argument. It is easy to see what was expected in every parish church in ante-Reformation times by the canons and constitutions in Lyndwode's *Provinciale*. But the answers to Edward VI.'s Commissioners, preserved in the Record Office, show conclusively that even the minimum of ornaments had been in many poor parishes entirely beyond the means of the parishioners. In fact, in whatever way the subject is approached, the same conclusion is reached—namely, that in the retention, or re-enactment, of the Ornaments Rubric in 1662, the leaders of the Church party were deliberately preserving for future and (as they hoped) better times the privilege of legally wearing a distinctive dress at the highest act of Christian worship. The fact that we have witnessed in our days the revival of such a dress proves the wisdom of their policy. Had equal wisdom been shown in the circumstances of such revival, the Church would not have been in that state of internal dissension which all but its worst enemies must now deplore. Mr. Hope urges with great force upon many of the Bishops the *in quoque* argument that the use of a pastoral staff, which they have themselves adopted, is only justified by the assumption that the Rubrics of 1549 are still binding. With what consistency can these offenders condemn the inferior clergy for reviving such other parts of the same rubrics as concern themselves?

We next come to the argument for the eastward position of the minister at the Lord's Table. Mr. Hope gives a complete summary of the whole controversy. The eastward position was ruled to be legal under the existing rubric by the judgment (delivered by Lord Cairns) in the case of *Martin v. Mackonochie* in 1868. To the amazement of everybody, the subsequent judgment (delivered by Lord Hatherley) in *Hebbert v. Purchas*, in 1871, ruled the direct contrary. Within a few weeks of this decision, no less than 4,761 clergymen signed what is called the Purchas Remonstrance against this contradictory exposition of the law. It may be safely said that, so long as the English language remains, no legal subtlety can ever persuade men to believe that "standing before the table" means "standing at one end of it" in one part of the Prayer-Book, while it is allowed that "before the table" in another part of the same book—in the Marriage Service—means "in front of it." The judgment in *Hebbert v. Purchas*—an un-defended case, tried before a weak Court—was unhesitatingly condemned in a remarkable pamphlet by the venerable ex-judge, Sir J. T. Coleridge; while Lord Cairns, as Lord Chancellor, in a debate on the Public Worship Bill in the House of Lords in June of this year, expressed himself in these most unmistakable terms about it:—

Upon that subject there have been two decisions more or less final by the Judicial Committee of the Privy Council. I do not desire to say one word on the law of the question, but every one knows how extremely difficult it is for any person—for any layman, perhaps for any lawyer—to be satisfied that

those two decisions are reconcilable with each other. In one of these cases no defence was made, and only one side was heard. Those decisions, I think, cannot be regarded as final.

In the end Lord Cairns seemed to expect that the ultimate decision would be that the priest's position at the altar must be ruled to be *in dubio*. It is for this solution of the matter as an open question that Mr. Beresford Hope strenuously contends. There is as much charity as there is wisdom in this conclusion. For, as things are, a rule of rigid uniformity of practice would grievously distress one side or the other. The most enthusiastic partisan of the west side would, we are sure, shrink from enforcing this position on a reluctant clergyman; and had there been more discretion shown in not adopting the practice until people were prepared for the change, the present confusion would never have prevailed. The controversy, which is curiously complicated by the circumstance that the existing rubrics prescribe a position for the altar itself which has long fallen into absolute desuetude, is a very uninteresting one to any but experts or those whose practice is affected by its issue. Mr. Hope examines the whole question with his usual fairness and completeness. We note, in the course of his discussion, an important authority for the use of the word "altar" in the Canons of 1640, which is too often forgotten by controversialists. The Canon cited ends with these words:—

We declare that this situation of the Holy Table doth not imply that it is, or ought to be, esteemed a true and proper altar, whereon Christ is again really sacrificed; but it is, and may be, called an altar by us in that sense in which the Primitive Church called it an altar, and in no other.

There can be no doubt, we think, in a candid mind, that when Laud's reform moved the altars generally back from the longitudinal position in the chancel or nave to the transverse position at the east end of the chancel, the ministering clergyman, who had hitherto stood at the north side, followed the transposed table and now stood at its west side. In other words, the north side became the west side, when the table was turned half round. The truth is that, as the table now universally stands, no one can stand at its north side; for the table has no north side. It has a north "end"; but, as Archbishop Williams argued, the end of an oblong table cannot strictly be called a side. There is, in our own view, no difficulty whatever in a man's obeying the rubric to "stand before the table" at the time of the prayer of consecration; for "before the table" would be at the north side if the table stood longitudinally, and at the west side if it stood, as it now always stands, transversely to the axis of the church. The real puzzle is, not to know what "before the table" means, but to know what "the north side" means under the present state of things. No one can doubt, however, that the Caroline divines, who succeeded in bringing about the change of position of the table, found it very much more difficult to change the position of the priest. From this ambiguity arose the practice of the minister standing at the north *end*—a position so inconvenient, so incongruous (we had almost said), that no religious body ever before thought of this place for the celebrant. It is a most tedious inquiry as to what the actual practice of the Caroline divines was. Common sense would suggest that there must have been a diversity of practice, according to the circumstances of each case and the temperament and convictions of individual clergymen. Certainly some stood at the north *end*. It is equally certain that many, including those of highest ecclesiastical rank, stood, when it was possible, at the west side. It is true that Laud himself, and Wren, when on trial for their lives (as Mr. Beresford Hope pertinently remarks), alleged that they stood at the west side for reasons solely of convenience. But there is evidence, as for example in the most remarkable description of the consecration of Dore Abbey church in 1634 (just published for the first time by Mr. Russell, from manuscripts in the British Museum and in the Lambeth Library), that Bishop Wren, when acting with perfect freedom, ruled the west side to be the proper place for the minister at the prayer of consecration. "One example like this," says our author, "is worth a bushel of conjectures." We agree, too, with his argument that Wren's suggested form of the Consecration Rubric, proposed in 1661 (as given in the Bishop of Chester's *Fragmentary Illustrations of the Book of Common Prayer*), "points at, without daring directly to enforce, the eastward position." Wren had suffered a harsh imprisonment of eighteen years, though—more fortunate than Laud—he had saved his life. It is no wonder that he was perhaps over-cautious after such an experience. But it seems to be a safe conclusion that he had never altered his convictions. There is especial value in Mr. Hope's remarks on the real state of feeling among the Churchmen of 1662, as affecting the policy of the then Bishops in the revision of the Prayer-Book. He well observes, after insisting on the difficulties of those times:—

Those difficulties, I fully believe, would furnish a very ample justification to the restorers of liturgical order for—as in the case of the Ornaments Rubric, so in that of the position—appearing to us to have been reformers in purpose more than reformers in deed, satisfied with leaving on record sound views for a future generation to deal with.

Upon the whole, as we said before, there is every probability that, as Lord Cairns not obscurely intimated, the condemnation of the eastward position of the celebrant will be reversed when the case comes to be argued on both sides before the new final Court of Appeal. Should it not be reversed, we think that the issue will be serious, in view of the grave words with which one who has so much right to speak as Mr. Hope concludes this part of his book:—

If I have written [he says] strongly on this question of the priest's

position, it is because I feel very deeply upon it, more deeply than upon any other question of controverted ceremonial; and I believe that vast numbers, both of clergy and laity, are animated by the same strong sense of its importance, and would equally feel any restriction in this respect of their Christian liberty. If the authorities in whose hands the ultimate solution of all such questions lies were to refuse and to prohibit a distinctive Eucharistic dress, I should regret their decision as a mistake, a misfortune, and a loss; but I should wait in patience for days in which reason might have the advantage of prejudice. But if, at the highest moment of Christian worship—when God's priest more impressively pleads Christ's sacrifice, in Christ's own words, in Christ's own ordinance—loyal and peaceable children of the Church of England were to be forbidden to unite themselves with that priest in the great act, according to the order in which the Holy Catholic Church has, from the first, been wont to show forth the Lord's death, while thoroughly acknowledging that the efficacy of the sacrament was no way affected, I should in my inmost soul feel that there was a great wrong done.

In a similar spirit Mr. Hope dissembles in the remainder of his book the other ceremonial details which are in dispute. Of these many people care very much for the two lighted candles, and for the mixed chalice; and some care for the certainly less important, if not more doubtful, points of incense and the use of unleavened bread. We need not enter into these discussions. In a final chapter of great interest Mr. Heresford Hope earnestly defends the comparatively simple, even when most ornate, ritual of the English Church in comparison with the unreformed use of Sarum and the modern Roman ceremonial. Here, too, he enlarges on the danger of disquieting and disgusting those classes of the population who have been so powerfully attracted, not by the excesses of a few extreme men, but by the energy and self-denial of that large High Church party which has reformed and vitalized the worship of the Church of England. This is a consideration well worth the notice of those who would take a statesmanlike view of the crisis. We are not indisposed to believe that, with some few exceptions, the Bishops as a body know less of the temper of the times than the working clergy. These are undoubtedly anxious times, in view not only of possible disestablishment, but of the advance of a band of foes inconceivably more dangerous than the most extreme "ritualists"—namely (as Mr. Hope enumerates them), "apathy, false doctrine, scepticism, superstition, and open vice." These, in fact, are the real perils of the day. Mr. Hope deserves thanks for the courage with which he has defended an unpopular side, and has told to zealots of either extreme some wholesome but unpalatable truths. We wish we had space to quote the whole of the peroration with which his volume concludes. We can only make room for one passage, which seems to us such as must carry conviction with it to all but the most narrow and prejudiced opponents. It is chiefly addressed to the Bishops who timorously, and in some cases (it is believed) against their own better mind, supported that unhappy measure of the two Primates which Lord Shaftesbury afterwards manipulated into the Public Worship Regulation Act, as it became law:—

After all, let us take ultra-ritualism at its worst. Let us stamp its often defective appreciation of the temper of the times with the most condemnatory brand of impolicy, let us most sharply rebuke its deviations from the spirit and the code of the English Church, but then let us ask ourselves, Is it the worst evil of the times? Is it a festering sore, or is it the vicious excess of God's wonderful revival of religious life in our Church, a revival which by the law of human progress could not have gone so far without developing an extreme phase? Let us as men and as Christians look at the conditions of spiritual things about us. Let us first inquire among Churchmen, and ask whether it is the ritualists who keep their churches closed from Sunday to Sunday? Is it the ritualists who evacuate Christ's own Sacraments of any special grace? Is it the ritualists who, in their zeal for preaching, too often neglect the ministrations of God's Holy Word to the sick in mind and body? Is it the ritualists who inflate the sovereign virtue of faith until they place themselves upon the slippery pinnacle of Antinomianism? Is it the ritualists who, in their zeal for private judgment, deprave the inspiration of the Holy Scriptures, and use language suspiciously doubtful of the divinity of our Blessed Lord and Saviour? Is it the ritualists who struggle to engraft the fanaticism of spiritualism upon the mysteries of the Gospel? Are there, or are there not, such men as I have described in the ministry of our Church, and do they or do they not belong to the ritualist fraternity? Outside of the Church is there no cold, despoiling materialism in much honour in the high places of science? Has the mocking genius of Voltaire ceased to inspire the guides of public opinion? Are not our millions corroded with the canker of a suspicious, self-sufficient, uninquiring negation of belief? When there is a recoil from this hopeless condition, is it not too often into some wild forms of grotesque unblessed superstition? Beyond the labyrinth of scepticism, or the abyss of mere atheism, is there not a hell of gross unbridled vice yawning at our feet? Yet those upon whose shoulders the chief responsibility of Christ's Church in this realm rests can pass by these things, and employ that secular position which, as peers of Parliament, they may possess, for the harshest censures upon their younger brethren in the ministry, who, whatever may be their aberrations of opinion or of practice, hold fast to their unwavering faith in the Ever-Blessed Trinity, and in Christ's atoning mediation: who are instant in season and out of season, in sickness and in health, in their ministrations of God's Holy Word and sacraments, and their unsparing temporal help in church, and at the bedside of the indigent sufferer; who are ever planning, discreetly or indiscreetly, but with the single end of God's glory and the comfort of His people, new schemes and fresh societies of Christian help.

We wish we could hope that this earnest and touching remonstrance would take effect in the quarters to which it is directed.

HARTING'S WHITE'S SELBORNE.*

A SIMPLE reproduction of White's *Selborne*, with no other addition than the illustrations of Thomas Bewick, would in

* *The Natural History of Selborne.* By the Rev. Gilbert White. The Standard Edition, thoroughly revised, with additional Notes, by James E. Harting, F.L.S., F.Z.S., Author of the "Ornithology of Shakespeare." London: Dickens & Son. 1874.

itself be welcome. But still greater interest attaches to the new edition which has just been put forth by Mr. Harting, in that, rather more than a century after Gilbert White's first appearance in print, a competent naturalist has, by the collation of the original quarto, and a supply of concise editorial notes, to the exclusion or considerable retrenchment of the voluminous annotations of Bennett, enabled modern readers to gauge for themselves the progress made in the most attractive of sciences during that period. The physical changes which have taken place in the parish of Selborne within eighty or a hundred years—in barren tracts now clad with oak and larch, in lakes and ponds thoroughly drained and converted into grazing-land, in fauna and flora diverse in regard both to omission and addition—are not one whit more remarkable than the concurrent enlargement of the information of naturalists upon those speculations and problems which are discussed by the author of this charming English classic in his letters to Thomas Pennant, tourist, natural historian, and antiquary, and to Daines Barrington, the accomplished author of the "Miscellanies." It is interesting to observe how many valuable hints have been furnished by this correspondence. Thus, in his fortieth letter to Barrington, White suggests the advantage to our northerly and grazing kingdom of a thorough study of grasses, "to distinguish the annual from the perennial, the hardy from the tender, the succulent and nutritive from the dry and juiceless"; and it is needless to say how amply and thoroughly all this has since been done, not only by such practical writers as Sinclair, Curtis, and others, but by such popular writers as Miss Plues, and even by the foremost nurserymen and seedsmen in their often instructive catalogues. Again, in the thirty-fourth letter to Pennant, White, having discussed the *Acanus* or harvest-bug, the *Musca putris* or "jumper" which infests the bacon-rack, the *Coleoptera* or "black dolphin" or turnip-fly, so abhorred by the farmer, or the particular *cestrus* which annoys horses, and which Mr. Harting identifies with the "spotted-winged bot-fly," points out the desirableness of "a full history of noxious insects, hurtful in the field, garden, or house, with a record of the known or likely means of destroying them"; and the labours of Kirby and Spence, Curtis, Newman, and others, have gone far to supply this want. For the turnip-fly, by the way, the best antidote is free and frequent liming of the fields. It is indeed surprising to note, through the means of comparison afforded by the text and notes of the present edition, the vast strides which have been made by science since the first publication of the book. When White wrote to Pennant and Barrington about indigenous bats he knew but the two kinds known to Linnaeus as European, the long- and short-eared. Subsequently he noted in the thirty-sixth letter to Pennant a third, the great bat, and Pennant himself became acquainted with a fourth, the horse-shoe bat. But these four indigenous species are now in England multiplied to four times four. In like manner, with regard to the English species of birds, Gilbert White claims for Selborne parish nearly half the species then known in Great Britain, and makes the total, thus halved, 252. But now, as the editor tells us in a note (p. 125), the number of so-called British birds is about 395, of which 130 are residents, 100 periodical migrants, 33 annual, and the rest accidental and rare, visitants. In the knowledge of plants the advance is not less marked. Whereas White knew but three species of crocus (*sativus*, *vernus*, and *nudiflorus*), upon the lowest computation the species of crocus now known to botanists amount to 47 (p. 252, and note *ibid.*)

In some of his observations on birds White failed to attain to the certainty of modern inquiry—e.g. where he regards the "humming," "drumming," "piping," or "bleating," as it is variously termed, of the snipe, as ventiloquous. In his second notice of the subject he remarks, in passing, that "some suspect it is made by their wings" (p. 60); but inasmuch as this sound is never heard except when the bird is on the wing, he might have anticipated, had he given more consideration to the subject, the conclusion of the German naturalist Naumann, which Mr. Harting adopts, that it results from "a vibratory motion of the wings." Elsewhere he does unconscious wrong to the smaller "willow-wren," and becomes responsible for the wholesale slaughter of a tribe peculiarly friendly to the gardener, by the assertion that these birds are "horrid pests in a garden." It is the garden-warbler, as the Rev. W. Herbert has remarked, which eats the cherries, whereas the incriminated willow-wren frequents the fruit-trees, not for plunder, but to peck off the *Aphides* which are injurious to them. Again, he holds in one or two places that no redwings or fieldfares have been found to nest in this country, but a long and copious note of the editor's in p. 159 furnishes so large a list of well-attested exceptions as may be said to have a contrary effect to that of proving the rule. The suggestion of hibernation as against migration, which throughout his pages is a recurring cause of discussion, is now proved to be untenable.

It would be easy to collect an endless list of ornithological, entomological, and kindred problems, which White propounded and discussed, even if he did not invariably succeed in solving them. For instance, he is dubious as to the white owl's hooting, and does not arrive at the modern discovery that it does hoot, though sparingly, and has another sound when irritated—namely, screeching. His question as to the regions to which, if at all, swallows migrate, is left by him to the last in doubt. He propounds, but by no means settles, the question whether insects are or are not endowed with organs of hearing. Philo-sophers, he remarks, are agreed on a negative conclusion, and he is inclined to compromise the question by admitting the possibility of their feeling the repercussion of sounds. Here—

upon Mr. Bennett, the able though prolix editor of the hitherto standard edition, acutely observes that the fact of one sex of insects being able to produce sound involves the power of hearing it on the part of the other sex, and that in effect White insinuates the possession of this sense when he says that possibly the males make their noise out of rivalry and emulation. But the experiments of Brunelli have settled the question that both sexes hear, and are not simply affected by repercussion. Imitating the chirping of caged grasshoppers, he found a chorus of response from them to his chirp (see p. 244). With regard to the generation of eels, White surmised that it might be connected with the threadlike bodies sometimes discovered in them. These are now established to be intestinal worms, and the observations, says Mr. Harting, of Yarrell on the reproduction of eels leave little doubt that they spawn like other fishes. Again, the Selborne naturalist appears to have thought that otters were exclusively piscivorous, whereas it is quite certain that they are carnivorous as well, and have been known to eat ducks and teal, and, whilst in confinement, young pike (see p. 97, note). The fact that they are amphibious would seem to imply this, whereas White's statement—"quadrupeds that prey on fish are amphibious"—is surely incomplete. In some cases White is apparently inclined to endorse country gossip and old-wives' fables, as where he credits the story that the viper opens her mouth and swallows her helpless young, on sudden surprises, for their protection—a popular error arising in all probability from the circumstance of fully formed young having been found in the stomach or abdomen of the mother ready to be extruded (p. 65, n. 1). In like manner he accepted the belief of the vulgar that the phosphorescence of the glow-worm was sexual. In his pretty copy of verses on the "Naturalist's Summer Evening Walk" he finishes with an allusion to this:—

The chilling night-dews fall: away, retire;
For see, the glow-worm lights her amorous fire;

and he further compares the female glow-worm to Hero lighting love's meteor for Leander. But Mr. Harting states as a fact that both sexes of the glow-worm are phosphorescent, "not only in the perfect insect, but also in the larva and even pupa state" (p. 84). On the other hand, White withholds his credence from the story current in his day near Hungerford relative to the cure of cancer by means of toads; and he suspects, if he does not detect, the quack doctress in the old woman who stated that she had herself learnt this special gift of healing from a clergyman who had cured her by this method, and transferred his secret to her. It is rather of a piece with his wrong to the willow-wren that White detracts from the hedgehog's mission of tidiness in destroying the plantains on garden walks, by charging them with digging little round holes in them. As Mr. Harting notes, this is a libel. The letters of "Rusticus" have established that this round hole is the work of a night-eating caterpillar, which afterwards turned to a "ghost-moth," or "yellow-underwing."

"Every kingdom, every province," writes the genial naturalist in p. 154, "should have its own monographer," and his own monograph on Selborne is still a model of what a parish or district history ought to be. Changed as are its natural features, we seem to take a bird's-eye view of the village, its "Plestor," and its "Temple," its ponds, its slopes, and its forest, no less than of its flora and fauna, as they were in the days of the writer. He transmits, too, an example of patient observation worthy of the closest imitation by even the best of our latter-day naturalists. The beeches about his daily haunts thrive on the free-stone formation which is analogous to their favourite chalk; the moisture distilled from deciduous trees entwined with much ivy is most copious (a hint what to plant round ponds designed to be perennial), and these and similar observations are not only curious but practically useful. The features of Wolmer Forest and its sister, Alice Holt (still a Royal Forest), are vividly presented—the former as a barren and cheerless enclosure, the latter a rich and well-timbered range, with noble oaks overshadowing the most velvety of turfs. Gilbert White records that the red deer, which at the beginning of his century numbered no less than five hundred head in Wolmer Forest, never by any chance overstepped the boundary which separated it from the Holt Forest, the latter enclosure being the special haunt of the fallow deer. The kindly naturalist was among the first to point out the injury to the morals of the neighbourhood arising from such a standing temptation as large herds of deer; but he does not seem to have hit upon the natural cause of the fallow and red deer observing strictly a boundary line which was no more than a simple hedge. Mr. Bennett and Mr. Harting, however, trace it to the fact that the richness of meadow and nobleness of oak covert which are the characteristics of the *gault* formation of Alice Holt adapt it specially to the exotic and half-domesticated fallow deer, whilst the harder and native red deer subsist as congenially on the coarse fare and dreary cheerless wastes of the forest so called of Wolmer. It is interesting to learn from a note of the editor that this forest took its name from a lake which, in White's day, was one of the three—Hogmer, Cranmer, and Wolmer—within its limits. They took these names from three wild animals, all now extinct in Britain, the hog, or wild boar, the crane, and the wolf. Another topographical feature of the Selborne district pointed out by White is Hawkey Slip, a standing memorial of a great landslide which occurred in the March of 1774, "when a considerable part of the great woody hanger at Hawkey was torn from its place and fell down, leaving a high free-stone cliff naked, bare, and

resembling the steep side of a chalk pit." Sapped and undermined by the melting snows of a memorable winter, it slipped its moorings, and went down a perpendicular direction, settling with its gables and oak trees *in statu quo*, some forty or fifty feet lower, after its desperate leap. The record of this in p. 261 suggests to Gilbert White an explanation of fables about walking hills and travelling mountains in Baker's Chronicle, and of the legend touching Mareley Hill in Philips's "Cider"; and there are many other indications in the Natural History, as well as in the Appendix of Antiquities, which prove that White, like his correspondent Pennant, conceived a large and comprehensive idea of the scope of a monographer. A great many of his meteorological observations are so sound as to have been confirmed both by later corroborative facts and by the inquiries of those who have given less divided study to the subject. He has linked natural history with scholarship again and again in his pages in such wise as to make his book the very best to put in the hands of a schoolboy. He is the best of gossipers—in spite of the lapse of years, and the labours of later imitators—on the sociality of animals, on the *strophyn* and *antistrophyn* of birds, and the curious diversity of their walk and step, their air, notes, and language; and he has discriminated more clearly than most of his fellows the wonderful faculty of "instinct," which, as he says, "in some instances raises the brute creation as it were above reason, and in others leaves them so far below it" (p. 288). In a word, Gilbert White, in his retirement and cultivated leisure, making his notes and observations, afoot or on horseback, of the whole field of nature within his compass, remains to this day an example for the country gentleman or village rector, with time on his hands, how to make a life remote from towns both pleasant and instructive. Mr. Harting has discharged his editorial task with tact and ability, and is entitled—as are also his publishers—to the cordial thanks of the reading public for having so reproduced this delightful book.

IN THE DEAD OF NIGHT.

CHARACTERS sketched in the broadest lines and painted in the deepest tints; a plot constructed with a fair amount of technical skill, yet defaced by childishness of detail, improbabilities amounting to impossibilities, vulgarity, and want of ordinary moral principle, side by side with a great deal of extraordinary high-flown sentiment; slipshod grammar; odd little touches of feminine spite; and minute descriptions of things which do not help to make the story clearer, or the scene more vivid—all these characteristics recall the fine Roman hand of a veteran novelist well known to the public. Unless Mrs. Henry Wood has a double in literature, we are much tempted to place *In the Dead of Night* to her credit; it is like so many of its fellows which we have already seen. We seem to have read it all before, and to have been introduced under other names and dresses to the several personages who meander through its pages, and the various mysteries with which it bristles. The piece of furniture which is to secrete an escaped prisoner; the clever disguises which cannot be seen through by the sharpest eyes—in this novel repeated twice over, two men being equally adept in the difficult art of false personation; the wax body in a coffin with a glass window, for identification of the corpse below, placed in a vault of the (Roman Catholic?) church of San Michele, near Como; the hand that had the habit of suddenly clutching Kester St. George by the shoulder, and the Voice that used to whisper in his ear "Come" in such a diabolical and suggestive manner; the burying of a name while the man still lives; the wonderful folly of the hero, to be matched only by the surpassing stupidity of the villain—we know it all by heart, and we cannot confess to any love for *stale rehashes*. We have no objection to a fine bit of sensationalism worked up with good effect. It may not be the highest kind of art, but it has a certain weird power of its own, and if its light is lurid, it is exciting. But sensationalism feebly conceived and childishly detailed is mere waste of time both for writer and reader; and such a weak-kneed, broken-backed scoundrel as Kester St. George inspires no other sentiment than one of pity for the misdirection of powers originally not without their value, and contempt for the public taste that can feed on such rank garbage.

It is impossible to review this book as in any sense a character novel. The three principal personages of the story are lay figures carved, jointed, and draped after types as old as Mrs. Radcliffe. First we have Lionel Dering, who, when the story opens, is living as "The Hermit of Gatchouse Farm," a desolate little holding somewhere on the North-East coast. Here this young man, in the prime of life and the zenith of his energies, is content to remain, if not wearing away his strength in morbid regrets, yet at times giving way to something very like despair; as he himself pathetically puts it during a storm, "Like my life—like my life, without byre or homestead," which we venture to think is almost a unique specimen of a young man of twenty-eight years of age, with a gold-coloured beard, taking to self-pity because he has not a cow-house. Besides, having a farm, has he not naturally a homestead, and must he not have had a byre too? And, if not, could he not build one? Lionel has lost his fortune of twenty thousand pounds, and with his fortune his betrothed; but, instead of setting his shoulder to the wheel, strengthening his back for the burden, and doing what he could to repair the damage and remake

**In the Dead of Night.* A Novel. 3 vols. London: Richard Bentley & Son. 1874.

what has gone from him, he came down to this wretched little place, where "at one time he planted potatoes, at another dug them up," raised fine standard roses, in two years' time made a profit on his farm of one hundred and eighty pounds, worked as a day labourer on the land, and found life fashioned on this plan a reasonable and manly kind of thing. Yet his portrait, as the author gives it, scarcely bears out his actions:—

Lionel Dering at this time was twenty-eight years old. A tall, well-built, fair-complexioned man, but bronzed by much exposure to the sun and wind. His eyes were dark gray, very steady and penetrating. He had a habit of looking full into the faces of those with whom he talked, as though he were trying to penetrate the mask before him. It was a habit which some people did not like. He had never shaved in his life, and the strong, firm lines of his mouth, betokening immense power of will, and great tenacity of purpose, were all but hidden by the soft, flowing outlines of a thick beard and moustache, pale golden as to colour. His free, out-door life, and the hard work to which he had accustomed himself of late years, had widened his chest and hardened his muscles, and had ripened him into a very tolerable specimen of those stalwart, fair-bearded Islanders whose forms and figures are familiar wherever the English language is spoken.

His "tenacity of purpose" is soon called into play. Going home in a storm along the cliffs he sees, by a "blinding" flash of lightning, a man fall down a chasm. "An inarticulate cry of horror burst from his lips," and, "with beating heart and strained nerves," he presses forward to the place where he had seen the man. But when he gets there he is "standing there alone." As we have not a photograph or diagram of the chasm down which Lionel Dering descends in the dark, we cannot exactly make it all out, but the upshot is clear: He clammers down "the smugglers' staircase," which is a narrow gully or seam in the rock, not much wider than an ordinary chimney; but how on earth he manages in the dead dark, helped only by blinding flashes of lightning, is beyond us to understand. He does slip midway, and finds himself among the rocks at the bottom, "bruised, bleeding, and partially stunned." Nevertheless he clammers over the huge boulders in his way, the tide washing over him at odd moments, and at last his hand touches a "clammy, ice-cold face." But this brave man, who had dared so much and borne such horrors for the sake of finding a stranger's body, now "drew back his arm with an involuntary shudder." If nothing else betrayed the sex of the author, this ridiculous ascription of "nerves" to such a man as Lionel Dering would have done so. The whole incident, told with such a prodigality of detail, is absurd in treatment from end to end; but it seems to us that Lionel's sensitive shudder at touching the clammy face of the man he came to seek is the finishing stroke of all. This unfortunate person, who has tumbled down the chasm among the sea-shore boulders, and is now lying half in half out of the water, is, so far as Lionel "made out by the momentary glimpses which the lightning afforded him, young, fair, slightly built, and to all appearance a gentleman." He is a Mr. Tom Bristow:—

A slim-built, aquiline-nosed, fair-complexioned, young fellow; rather under than over the ordinary height; and looking younger than he really was—he was six-and-twenty years old—by reason of his perfectly smooth and close-shaven face, which cherished not the slightest growth of whiskers, beard, or moustache. Tom's first action on coming to his senses after his accident was to put his hand to his chin, just then bristling with a stubble of several days' growth; and his first words to the startled nurse were, "My dear madame, I shall feel greatly obliged by your sending for a barber." His eyes were blue, full of vivacity, and keenly observant of all that went on around him. He had a very good-natured smile, which showed off to advantage a very white and even set of teeth. His hands and feet were small, and he was rather inclined to be proud of them. His dress, while studiously plain in appearance, was made of the best materials, and owed its origin to one of the most famous of London tailors.

This Mr. Tom Bristow supplies the comic element which also would have been wanting to the story. He is as good a fellow as Lionel, but merrier and sharper; and to him and his universal ingenuity is owing the idea of the wonderful wardrobe where the former is concealed when Tom has managed his escape from prison. Indeed, had it not been for Tom, Lionel must have been hanged. For, as all the innocent suffer in novels and the guilty escape suspicion, Lionel is arrested for a murder he never committed, and Kester St. George, who is the real criminal, goes scot free until the end.

Mr. Kester St. George is the modern presentation of the villain in the play. He is a man of fashion, smokes "club cigars," breeds horses at Newmarket, and consequently has as good as sold himself to the Evil One, who every now and then puts in a reminder by the shadowy Hand that clutches his shoulder, and the ghostly Voice which whispers "Come." Kester St. George too loses his fortune, but in a different way from that which sent Lionel as a hermit to Catehouse Farm. The bank broke where Lionel had placed his legacy, which was an innocent and irresponsible manner of loss; but when the uncle who had adopted Kester, and always treated him as his heir, one night turned him out of Newton Park and forbade him ever to cross his threshold again, we must suppose that some glaring iniquity perpetrated by the young scoundrel who smoked club cigars and betted at races had come to light, and that he only received what he deserved. Of course when this uncle, Mr. Arthur St. George, dies, he leaves his whole property to Lionel; and naturally Kester feels more hatred than love for the cousin who supplants him; but, being wily and politic as well as bad and daring, he dissembles, and asks Lionel to breakfast at his chambers, where he refuses an offer made by the latter of three thousand a year, and, being the next heir should Lionel die unmarried, is on the point of shooting him through the head, as the settlement of a difficult position. Why he does not kill him at some time or other is one of the most

surprising things in this story of surprises. He has no kind of conscience, and is quite ready to kill any and every one who stands in his way. Theft is a vice he does not disdain; and dissimulation of the most profound kind comes as easy to him as disguises to Tom Bristow and sincerity to Lionel. But, though he accepts the invitation which Lionel is fool enough to give him, and goes down to Newton Park as a guest, and not its master, he does nothing more heinous, by intention, than make Mr. Percy Osmond drunk, so that he may steal his cheque book, and give Lionel a sleeping-draught "for a headache," so that he shall not hear him go into Percy's room at night on this very likely errand. That the theft culminated in murder was not intentional; though he has no objection to his valet smearing Lionel's handkerchief and shirt-front with blood, and putting into Osmond's hand a flagstone gold stud which he abstracts from the virtuous young man's linen.

It is on this circumstantial evidence that Lionel is to be found guilty of murder; and it is to save him from the gallows that the peculiar talents of Mr. Tom Bristow are brought into play. He first of all manages his escape from prison by leaving a drugged and drunken old clerk in his cell as his counterfeit, he himself being cleverly made up as such an exact representative of some one else—who can prove an *alibi*—as completely to baffle detection and the police. With Lionel dressed in Creede's clothes, and he himself so like Mr. Hoskyns as to deceive every one he meets and talks to, the pair leave the prison, and Lionel is quartered in the room at Edith's house where the wardrobe is placed. Lionel and his lover Edith have been married while the former is in gaol waiting his trial; but the marriage is a profound secret, and apparently even the prison authorities are ignorant of it. Still suspicion falls on the household, and the cottage is searched; to no purpose for awhile; but as a policeman chooses to sit down overcome with thought in the fatal room, and as Lionel is a born fool all through, he opens the wardrobe door, and stands face to face with the sergeant. How the sergeant is bought off, and Lionel makes good his escape; how the police and the Home Office shut their eyes and make no effort to recover the escaped accused; how Kester walks in his sleep, and gets nervous over Osmond's dagger hidden in a tree; how Dobbs, his valet, is Lionel's paid spy; and how, finally, virtue is triumphant and vice in the dust, those who care to read can see for themselves. One little characteristic incident we must not forget. Kester St. George turns out to be no St. George at all, but a changed child, the son of an old hag, one Mother Mim, who had been the real Kester's nurse. Thus the honour of the St. Georges is saved; and when Lionel brings the crime of Osmond's murder home to him, and exposes him to the small world within four walls of his "sitting room," he has not frightened his cousin to death, only an impostor and a Mim. In conclusion we would ask but one question:—Is it not time for the author of *In the Dead of Night*, and so much similar work besides, to give up, at least for awhile, this wearisome grinding out of impossible plots, puerile mechanism, and worn-out types of character?

THE NEW AUSTRIAN MAP OF CENTRAL ASIA.*

WE have recently had occasion to notice the contribution to the military history of 1859 which we owe to Baron Kuhn's enlightened administration of the Vienna War Office, and in so doing we commented on that mistaken reticence which had previously been maintained by the Austrian Government with regard to all such matters. This foolish policy, which was due to the secret system of government dear to Hapsburg traditions, and to the desire to keep concealed that large share of the disasters of Austria which was due to Imperial intermeddling, has played directly into the hands of her enemies, who have been left to write their own story unchecked, and thus to lower the prestige of the Empire in the eyes of those who might have helped her. Indeed it is impossible at this late date to say how largely this blundering secrecy may have affected European politics. To give but a single instance. It is almost certain that the concealment of the shattering defeat administered in 1793 by a moderate army of Austrian regulars to Dumouriez's Republicans—a defeat which cleared Belgium of the French quite as effectually as Napoleon's final overthrow twenty-two years later—has contributed largely to the myth of the invincibility of the levies of the Revolution, and thus sensibly influenced French policy down to the time of Gambetta. It is to be hoped that the late change of administration at Vienna, which all Europe, a few military Conservatives only excepted, noticed with regret, may not throw the War Office of Francis Joseph back into the old course which brought on the crown of the Hapsburgs much discredit, and possibly some real danger, as it certainly was largely answerable for the chauvinism of the French.

But if Austria has hitherto purposely neglected that historical branch of Staff duty which has reached its highest development under Count Moltke, it has plainly not been for want of power of intelligence in her officers. In another department she has long been at the head of all Europe. For at least a generation past the topographical productions of the geographical section of her Staff have been simply unrivalled, not only in accuracy and fulness, but in the clearness of their execution, which for non-professional

* *Eine General-Karte von Central-Asien*. Von dem K. K. militärisch-geographischen Institut in Wien bearbeitet. Vienna: Gerold.

nae is certainly not less important. Every decent map of North Italy is founded on, or at least largely indebted to, that prepared for the use of Austria when she ruled without contradiction to the Po, and when intervention in Italian affairs generally was deemed to be a standing duty with the Vienna Government. The other parts of the loosely-knit Empire which stretches across Europe from Bavaria into Turkey, as well as the countries immediately round her borders, have been surveyed with no less care, and put on paper with the same originality of design; and if the affairs of Croatia or Dalmatia or Bosnia are riddles to the great majority of newspaper readers, it is not for want of excellent topographical delineations on which to follow them. The Austrian Bureau has been thoroughly original in its work. Discarding superfluous shading and unmeaning conventional details, it succeeds, by the aid of fine lines, clear printing, and the judiciously sparse use of colouring where allowed at all, in producing maps that give the eye just the information which it needs, instead of bewildering it with the multitude of engraver's flourishes which discredit a great part of the map work of our time. The system is being largely borrowed, and our own best workmen are themselves falling into what may be properly called the Austrian style, perhaps almost without knowing to whom they are indebted for the example. Yet even so lately as last year, when the Topographical Military Institute of St. Petersburg put out its greatest work, the map of Central Asia (*Karta Serednei Asii*, 1873), which was the best to be obtained until a few weeks since, the result of the conventional over-elaboration of details was that mountains, rivers, and lakes appear all to have got into such a mesh of lines as to be traceable only with difficulty, and important names are constantly overlaid and hidden. No one need send for this any longer, as the work just issued at Vienna under the auspices of General von Dobner, the able head of the Military Geographical Institute of that city, may be said to supersede all former maps of the same part of the world.

Perhaps the title of this map may be in some respects a misnomer. For the purchaser will probably be hardly prepared to find the often-used expression of Central Asia, vague though it certainly is, stretched to include the Persian Gulf, and even a corner of the Bay of Bengal. But it is notorious that the Austrian Staff has long interested itself in the problem of the future connexion of our Indian Empire with Central Asian affairs, regarding these in the usual limited sense. Baron Kuhn himself has the credit of being the author of a well-known pamphlet, some time since translated in this country by Major Wilson, the object of which is to show the vital importance which the neglected Euphrates line of communication with India may hereafter have for us if Russia should extend her present Armenian border to the southward of the Caspian. It is not surprising therefore that the Vienna Bureau should have thought its work would be incomplete unless the northern part of India formed part of it. And, in fact, the map has been carried so far that Sheet XII., the last of the series, is entirely given to Hindostan, and goes down, not merely to the Central Provinces and the country south of the Ganges, but to Surat on the Bombay side, and to the delta of the Mahanuddy, below Cuttack, on the coast of the Bay of Bengal. The Xth and XIth give the Persian Gulf completely, with Beloochistan and all that part of Arabia opposite which lies about Muscat, and in which Englishmen have lately become interested since they have discovered in the Sultan of Zanzibar an offshoot of its ruling house, and so got a glimmering of the fact, which our common histories ignore, that Arabs are really able to make voyages and found settlements just as though they were civilized Europeans like ourselves.

The map is in twelve sheets altogether. The first three, forming the upper or northern section, carry the view across that vast belt of country which lies between Siberia and the Khanates of Central Asia proper. On the left, in Sheet I., we get a glimpse of the Black Sea and of the mighty chain of the Caucasus, before which Russian progress towards Asia so long was barred. Alas for the shortsightedness and limited information of European politicians of thirty years since! We cannot leave this first sheet without observing how strikingly it shows a portion of the level tract along the western side of the Caspian, by which Russia turned the brave mountaineers completely before she could subdue them. And here such points as Jekaterinodar, Stavropol, and Jekaterinograd, with many others equally rough and new in appellation but ranking after these in importance, mark the links of the chain of posts; those mentioned being new settlements of some consequence, which bind Tiflis to the European capital on the Neva with which our fathers thought the Armenian plains could never be regularly connected by human means. Forts have evidently preceded commerce and population on this line, but commerce and population have not been long in following the lead set them by the art military; a truth remarkably illustrated as we pass on to Sheet II., and examine that province of Orenburg, now a settled and valuable part of Russian Asia, the local troops of which played as important a part relatively in the late Khivan expedition as our own Punjab Frontier force presumably would do if we were obliged to occupy Cashmere. Yet the greater part of the country covered by this sheet, now showing good caravan roads, protected by posts, and with all the appurtenances of a growing inland commerce, is that very land of the Khirgiz Tartars which a generation or two since was unknown and untraversed except by bold adventurers and robber tribes. Sheet III. brings this stretch of Russian territory to its eastern termination, the little-known part of Russian Turkestan called Tomak, which runs far into the great Altai chain; and singularly enough,

it gives, as claimed by Russia, a limit extending even further into Chinese Mongolia than that assigned by the Russian Topographical Institute last year, which at this point showed a humility to which the policy of St. Petersburg does not pretend. Here, too, for the first time the attempt is made to set clearly down the division between Turkestan, whose governor occupies so important a part in Central Asian policy, and the neighbouring territories of the Dzungari Tartars, the last relics of Mahomedan empire in that part of the world, with the exception of that ruled by the redoubtable Atalik Ghazee, whose newly created kingdom lies to their south.

This prince's dominions are seen to be really of very moderate extent, and are plainly in hardly more danger just now of Russian annexation than of being crushed by China. For the latter Power has abundantly proved its latent strength in the contest with the Mahomedan kingdom which but three years since flourished to the south-east of the Atalik Ghazee's dominions, and appeared to intelligent travellers to have obtained permanent independence, but which has now, as the Indian Foreign Department recently announced, yielded its last stronghold into the hands of the triumphant Imperialists. The sanguinary struggle that terminated in the destruction of the last of the so-called rebels of South-western China was but an episode of the religious wars which have been carried on for a century at least in Chinese Tartary. But the great change in the situation which has been wrought by Russia is clearly revealed in the map before us. When we examine the belt comprised in Sheets IV., V., and VI., which covers the space from the Caspian to Middle China, we find that the once independent Mahomedan sovereignties which lay behind Kashgaria, the Khanates of Khokand, Bokhara, and Khiva, are now all directly or indirectly dependent on Russia. The kingdom of the Atalik Ghazee has therefore now no kinship of religion among its neighbours to protect it if attacked by China with superior forces. In such a case, Yacoub Beg, if defeated, could only be saved from the extinction which has lately overtaken his imitators of Western China by the direct intervention of either Russia or England; and hence the existence of the sovereignty which Sir Douglas Forsyth has lately opened to our trade becomes an element of pressing importance in the question of the future of Central Asia.

This fact alone, and the general interest excited by the Forsyth mission and the new line of commerce for which it has cleared the way, would make the map, were it for this section only, a real acquisition. But it has the special attraction for the politician and soldier that the VIIth Sheet lays down, for the first time accurately, the position of the new fort of Petro Alexandrovsk on the Amoor, where Colonel Iannoff is posted to represent General Kaufmann in checking the Turcomans, and protecting or overawing Khiva as may be required. A glance will show how effectively it is placed for this purpose. The Russian garrison has, in fact, the complete control of the canal system which forms the oasis of the Khanate; and with this grasp of the throat of Khiva, the St. Petersburg Cabinet has the best strategic reasons for its late moderation in quitting the fallen despot's capital.

If we do but refer to the remaining section, that contained in Sheets VII., VIII., and IX., it is solely for want of space to do adequate justice to its merits. It comprises, among other territories, the great plateau of inland Persia, Afghanistan, and the countries from which the Hindoo Koosh and Himalaya ranges rise frowningly as though to warn Northern intruders off our Indian border. Even through the modesty of drawing for which this map is remarkable, the giant heights of this natural barrier are plainly to be noted, and will at once tell the student that, despite M. Lesseps's visions of steam flotillas on the Upper Amoor, danger to India will hardly come in this direction, whose ever may be the hand that aims to strike at us through our Eastern Empire.

BUCKMASTER ON COOKERY.*

IT is not now uncommon to find historians and theologians attributing to the Reformation countless difficulties, religious and political, which have since arisen. Mr. Buckmaster adds another accusation to the list already so long. He seems to lay to Luther's charge the scarcity of good cooks from which this country is now suffering. When a doctor is consulted by a new patient, his first anxiety is to find out the cause of disease; when this has been done, he may attempt a cure. Mr. Buckmaster has discovered the origin of the decline in English cooking; he does not, as he might naturally have done, follow out his own reasoning, and suggest Ritualism as at least a palliative for the time being. The abolition of feasts, which were not really feasts, but feasts requiring consummate skill in their preparation, is certainly quite a sufficient reason to give for the small attention which *soups maigres* receive in England; for the little account taken of vegetables as an *entrée*, and for the poverty of our invention with regard to the dressing of fish. A mediæval cook was hardly thought worthy of the name unless he could make any fish taste like woodcock without burdening either the consciences or the digestion of his master's guests. The suppression of the monasteries no doubt put an end to much convivial hospitality, and probably for the time being gave the deathblow to cooking as a science. Mr. Buck-

* *Buckmaster's Cookery: an Abridgment of some of the Lectures delivered in the Cookery School.* London: Routledge & Sons.

master asserts that at the beginning of the sixteenth century England was unrivalled, even by France, in the quality and variety of her food productions, but that with the Reformation came a great change in the domestic life of the people, and that soups, fish, and vegetables grew somehow to be associated with Popery. We may therefore assume that good Protestants took to eating good roast beef and plum-pudding, and banished out of the country at the same time Jesuits and French kickshaws. Perhaps some of the sisterhoods which have so successfully revived lace-making and embroidery may turn their attention to scientific cooking as a preventive of disease, and supplement their nursing establishments with classes for teaching those who are now responsible for many of the illnesses which doctors vainly try to cure with medicine.

In this small octavo of three hundred pages Mr. Buckmaster, besides giving a sufficient number of recipes to content in their variety any ordinary family, treats of everything under the sun—Druids and plain cooks, Anglo-Saxon customs and ladies' dresses, Romans and Sir Robert Peel, wild flowers and the colonies, guest-stores, marriage, education, religion, and chemistry; his words are no doubt words of wisdom, but they are terribly long words, and he calls London "this metropolis." An edition for the use of the kitchen, with marginal readings of such terms as approximative, coagulate, accelerate, retrogression, analogous, would be useful. With the cookery recipes there is little fault to be found. If not original, they are at least clearly given, and the essentials to success in each case are pointed out under the head of "Precautions." But we venture to suggest that in a future edition some further instructions may be added to the directions for making bread sauce, which now stand thus:—

Take a clean stewpan and put in six ounces of stale bread crumbs, with one pint of new milk and one eschalon; boil for two minutes, and the sauce is ready. *Precautions.* See that the bread crumbs are good, and take care that the sauce does not boil over.

Now no number of clean stewpans or pretty cooks could produce from this recipe anything but bread and milk tasting disagreeably of onions. What sort of calves'-foot jelly would an ignorant person be likely to make if all the directions given were:—"Take two calves' feet and a bottle of Madeira, and be sure the feet are fresh and the wine is old." In M. Soyer's *Modern Housewife* there are very good hints about bread sauce. They might with advantage be added as an alternative to Mr. Buckmaster's pap, which is only fit for invalids. On the subject of *fricandeau* we entirely differ from him, as he repeats the mistake which he made at South Kensington when directing the preparation of that dish. There, in appearance at least, it was completely spoiled by being turned when half done. The pupils were shown how to lard veal in the most approved manner; but they were also shown how, before serving, to destroy the dainty-looking quills. Generally in France the stewpans used for cooking such a dish have hollow lids in which charcoal can be put and the meat done simultaneously on both sides. Thus the ornamental part is not disfigured, and the *fricandeau* is an attractive dish, either hot or cold. The same result could be attained with a gas-stove. In Mr. Buckmaster's apple fritters, too, our faith is weak. He does not speak with sufficient diffidence on the subject, nor give any hint that, properly prepared, they are as rare as a good omelette. A cook who succeeds to perfection in this dish is always remembered in a house where perfect cooking is appreciated. It will generally be found that she mixed the batter several hours before she used it, to allow the flour to swell, and added a spoonful to each fritter whilst frying, to give them the spiky shapes which connoisseurs admire, but so seldom see.

Mr. Buckmaster seems to have leanings towards vegetarianism, and reminds his readers that the Pyramids were built by people who lived on lentils, garlic, and water. He prints chemical tables of the different amounts of different kinds of nutriment to be found in various foods, cereal and animal, and gives a hint to London belles by dwelling on the beauty of Daniel's complexion after his self-chosen diet of pulse and water. Whether his muscles would have stood the fatigues of a London season is quite another question; but as languid inanity is to be now rather the fashion, no doubt a course of Revalenta Arabica would be found both more wholesome and more successful as a cosmetic than even Rowland's Kalydor. Mr. Buckmaster, although decidedly not a Conservative, so far as bad cooking is concerned, is disposed to think with Mr. Gladstone, that sometimes the best reforms consist in going back. He longs to see every house presided over by his ideal grandmother, assisted no doubt by Solomon's paragon, to rise early and look after the maids. He would rejoice again to see a baker's oven in every cottage, and houses made of something more substantial than plaster and whitewash. He would revive the hotchpotch of the Anglo-Saxons, and perhaps serve us occasionally with a dish of parrots and onion sauce. It is to be hoped we may be allowed the modern invention of forks, as the Psittacidae are not praised by those acquainted with their bones and sinews. Mr. Buckmaster would not object to minstrels making sweet music in our eating rooms; they would certainly be preferable to a barrel-organ outside the windows, which only some people—notably, next-door neighbours—find favourable to appetite and digestion. He considers that dinner should be the event of the day—a social, elevating influence, a time when men exchange with their wives and children the courtesies of life, an hour for moral expansion, for lightness, brightness, and laughter, for making of marriages and the discussion of political problems. If all the hints in this little book were carried out, the millennium would have already commenced, for the world would not contain any more cross husbands or foolish

wives, ignorant servants or badly brought up children; no old bachelors, for being married would be cheaper than living single; no waste, therefore no poverty; no single-brick houses or smoke fogs.

With regard to servants Mr. Buckmaster has been singularly fortunate, having had in his own family only three during twenty-three years. Perhaps he took the precaution of adopting them young, as they seem only to have left his happy home to make the happy home of a husband, who, it is to be hoped, appreciates and is grateful for this treasure manufactured for him at Mr. Buckmaster's establishment. There she had at least the one great advantage of having no fellow-servant with whom to quarrel, as her master prudently kept only one at a time. On the subject of domestics in general Mr. Buckmaster piously observes:—

We cannot have a better example of what our behaviour towards servants should be than that afforded by Boaz in his language to his reapers, when he came into the harvest fields where Ruth the Moabitess was gleaning. Ruth, as we may all remember, was a young widow, living with her mother-in-law, Naomi. These two came down to Bethlehem in the time of barley harvest, and Ruth went to glean in the field which belonged to Boaz. Instead of flying into a passion and uttering oaths, or indulging in coarse jokes to those working and gleaning, the address of Boaz to his servants was, "The Lord be with you!" and they answered him, "The Lord bless thee!"

Mr. Buckmaster thinks the public institutions from which girls are sent into service are greatly to blame for the injudicious way in which they have everything done by machinery, so as to leave the matrons no power to teach the girls by practice the requirements of an ordinary house. He adds, more forcibly than grammatically, "Hot and cold water, coals, cleaning, washing, drying, and even scrubbing and sweeping, are done by steam; potatoes are washed, and food is cooked, not in pounds, but in tons. You might as reasonably expect a man to learn farming in a hothouse, as to obtain good domestic servants (except by accident) from large establishments." With respect to the School of Cookery at South Kensington, Mr. Buckmaster does not say much. He might have suggested that from many parts of the town it is not easy of access; that, to judge from some papers published in *All the Year Round*, the programme of last season gave much dissatisfaction; that the school does not profess even to try to supply the good plain cooks so much needed, and expected by some of the subscribers; that, owing to the restricted accommodation, an expensive staff, sufficient to instruct hundreds of pupils, is wasted on a class of twenty; that it has no claim to be called "National," and is still in a most unsatisfactory state. Mr. Buckmaster's prayers so fervently expressed, in language adapted from the Bible, for blessings on the seed he has sown at South Kensington, will no doubt be answered when the school is moved to some more central situation, and when the instruction given in cleaning coppers, which have no existence in a middle-class kitchen, does not take up the principal portion of the course of lessons. Its fate at present seems shadowed forth by the collapse of the International Exhibition, but possibly that unsuccessful bazaar had not the benefit of Mr. Buckmaster's prayers.

CHRISTMAS BOOKS.

ETCHINGS on the Loire and in the South of France. With descriptive letterpress by Ernest George, Architect, Author of "Etchings on the Mosel." (John Murray).—Among the original works of art—far too few in number—which have this year come before us, Mr. Ernest George's etchings must certainly hold the first place. Any one who is at all familiar with the ancient towns of France will find in these illustrations much that will very pleasantly remind him of days passed amidst most picturesque scenes. As works of art alone, standing by themselves and without the added charm that comes from memory and association, they are very pleasing. The least satisfactory part is the letterpress, a matter happily of but very slight importance when the etchings are so excellent. Two views are given of Angers and two of Carcassonne. In both cases, though the views are quite different, we have the same descriptive narrative given. In fact, at least three times in the book we are told that "Henry II. of England, Count of Anjou, in remorse for the murder of St. Thomas à Becket, built and richly endowed a hospital." A somewhat full description is given of the arrangements of this hospital. Mr. George moreover is surely much too confident when he states as a positive fact that a castle was built at Amboise by Julius Cæsar. However, illustrations so good would make up for letterpress even if it were ten times as faulty.

Flemish and French Pictures; with Notes concerning the Painters and their Works, by F. G. Stephens, Author of "Flemish Relics" (Sampson Low and Co.).—Mr. Stephens has made so long and so careful a study of the school of art which he illustrates in this handsome volume that he could scarcely fail, when he came once more to write on his favourite subject, to put forward much that was instructive and interesting. While then we find much that is valuable in his critical remarks, and in the comparisons that he draws between different artists and different styles of painting, we cannot but regret that he falls too often into inartistic, if not faulty, English. The art critics of the present day have for the most part a mannerism quite as strongly marked as the mannerism of the artists themselves. They show as little gracefulness when they handle their pen as the præ-Raffaellites show when they handle their brush. Mr. Stephens, for instance, thus opens his book:—

"The making a comparison between the French and Dutch schools, including in the latter the Flemish school, its close ally, is one of the most curious and instructive tasks," &c. He shows, too, a curious ignorance of ancient history when he uses the fact that "in the Two Sicilies the prevailing artistic motive power was unmistakably of Greek origin" as a proof that "the land of Naples has proved obnoxious to influences which were foreign to its Italian connexions and proper nationality." We shall next have some author using the fact that in this island the prevailing tongue is unmistakably of Teutonic origin as a proof that England has proved obnoxious to influences which were foreign to its British connexions and proper nationality. We must not dwell too much, however, on the faulty side of a book which is for the most part written with great learning, and is on the whole very interesting. The twenty etchings which illustrate it are admirable in their way.

The Shilling Entertaining Library. Edited by J. S. Laurie. Illustrated by H. Sanderson. (Marshall and Co.)—We do not like the plan on which this Entertaining Library is published. "Children and working-men," says the editor, "cannot possibly be induced to read until they find out what a wealth of entertainment is concealed under the hard, ungraceful forms of typography." The love of pleasure, it would seem, is at once an instinct and the dominant principle in the human breast, and to this principle and to this instinct typography with its wealth of entertainment must appeal. The editor accordingly has taken such works as *Gulliver's Travels*, *Robinson Crusoe*, and the *Vicar of Wakefield*, and, "assuming the right of adapting the original texts so as to suit his purpose," has knocked them about and cut them down as if the dominant principle in his breast were a love of change. "Grammatical constructions which are too involved and difficult will be simplified." We had always thought that Swift's style was so simple that no change could be made in it that would not lessen its simplicity. The editor thinks otherwise, for he has recast his phrases and amended his grammatical constructions. In *Gulliver's Travels* we read, for instance, "I answered in a few words, but in the most submissive manner, lifting up my left hand and both my eyes to the sun, as calling him for a witness." Children and working-men would be puzzled by the word "him," and so the editor puts in its place "that luminary." Gulliver in another part writes:—"My hours of leisure I spent in reading the best authors, ancient and modern, being always provided with a good number of books, and when I was ashore, in observing the manners and dispositions of the people, as well as learning their language, wherein I had a great facility by the strength of my memory." When "the wealth of entertainment" that is concealed in this passage is brought to light it appears in the following form:—"My hours of leisure I spent in reading the best authors, ancient and modern, being always provided with a goodly number of books; and when I was ashore I occupied myself with observing the manners and dispositions of the people, and with learning their language. In the latter object I was greatly aided by the strength of my memory." The opening sentence of the *Vicar of Wakefield* has been struck out. We read in the preface that "in all cases passages which are unsuitable to the young will be expunged." Can the good Vicar's views on the duty of marriage be looked upon as improper?

The New Hymn-Book. Adapted to the services of the Church of England, with accompanying Tunes. (Rivingtons).—Of making of hymn-books there would seem to be no end. Each year sees a new selection which supplies some deficiency that is generally felt, and which in its turn is found to be defective too. This Hymn-book, however, has been compiled with evident care and judgment, though we think it would have been better if the editor had kept still more strictly than he has done to the very words of the original writers. He has been careful enough to mark the fact in each case where a variation has been made in the text; we only wish that there had been yet fewer variations to mark. The musical part of the book deserves high praise. We find many of those old sterling tunes which have held their ground amidst all the changes of taste, and some valuable contributions from several of our best living writers of Church music. Mr. James Langran, the musical editor, deserves no small praise, not only for the careful way in which he has collated and edited the music, but also for his own contributions.

Supplement to Harvesting Ants and Trap-door Spiders, by J. T. Moggridge, F.L.S., F.Z.S. With Specific Descriptions of the Spiders by the Rev. O. Pickard-Cambridge. (Reeve and Co.)—It would seem from the introduction to this work that, to the store of knowledge which has been already heaped up by the naturalist as regards ants and spiders, fresh material is being rapidly added. We may apply to the author what the poet said of the ant which is the object of his investigation:—

Trahit quodcumque potest atque addit æervo.

Hence a work which has so lately left the printer's hands already requires a supplement. Mr. Moggridge and Mr. Pickard-Cambridge have not only considered the ant, but have brought to the consideration observant eyes and accurate minds. Their little work is very interesting, even to a reader who knows next to nothing of natural history. Especially interesting to him would be a curious decision that is given of an ancient Rabbi, by which it was settled what portion of the granary of the harvesting ant should belong to the owner of the field and what part to the gleaners, if it was discovered after the reapers had passed it. In that case it was decided that the upper part of the heap belonged to the gleaners, for it would be to a great part composed of the fallen ears, but the

lower part belonged to the owner, for that had been formed before the gleaners' rights began.

The Peep Show: Amusement and Instruction for the Young. With two hundred and fifty pictures. (Strahan).—We should think all the more highly of this book if it had been somewhere stated that it consists, at all events to a considerable extent, of matter which has already appeared elsewhere. Not a few of the illustrations were published in *Good Words for the Young* some two or three years ago.

The Sunday at Home: a Family Magazine for Sabbath Reading. (Religious Tract Society).—There is a good deal of fairly interesting reading provided in this large volume. It would have been as well, however, if the writers could have kept to a somewhat simpler style. We read that John Hampden "had not procrastinated the grand preparation till the last moment"; while, in describing a visit to Great Hampden the writer says, "It is no lawless stretch of the imagination to picture those well-known shades (Cromwell and Waller) moving up and down this long chamber in conversation with their earnest-hearted 'cousin.'" Cromwell and Waller were certainly well known, and may now with propriety be described as shades; but yet in this world, at all events, they have never been well-known and shades at the same time.

The Leisure Hour, which is issued as a companion magazine to the *Sunday at Home*, and resembles it in its general arrangement, seems on the whole to be the more interesting.

Aunt Charlotte's Stories of Bible History for the Little Ones, by Charlotte M. Yonge, Author of the "Heir of Redclyffe." (Marcus Ward).—We see little advantage in such a work as this. In all Bible reading, though we certainly would not give a child the whole Bible, yet on the other hand we would give him nothing but the Bible. Who can make the story of Joseph, for instance, simpler than it is? "To explain," as Johnson says, in the preface to his Dictionary, "requires the use of terms less abstruse than that which is to be explained, and such terms cannot always be found." Whoever tries to change the language of the narrative part of the Bible must of necessity render that which was clear before somewhat less clear now. It is of the utmost importance that a child should not only know the Bible stories, but should know them in the Bible words.

Much more satisfactory is Miss Yonge's companion work to this volume, *Aunt Charlotte's Stories of French History*. (Marcus Ward).—The stories are well and clearly written. We like the plan of teaching young children history in a series of stories, even though great gaps may be left in the narrative, and important periods passed over. We could have wished, however, that the stories had been fewer in number, so as to admit of greater detail.

Stories of Bird Life, by Henry Berthoud. With one hundred illustrations. (Nelson and Sons).—It is a pity that our author, who in his "facts and anecdotes illustrative of the habits and intelligences of the feathered tribes" has much that is interesting to tell, cannot write more simply. We wonder what "the juvenile reader" for whom he writes will say when he reads that birds "must undergo the imperious exigencies of the medium in which they find themselves placed." In the next page the author wishes to state that two sparrows have so built under a rain-spout that their nests do not get wet. He writes:—"The constructors have placed it so that this large gargoye, which sometimes vomits absolute avalanches of rain, cannot let fall a single drop upon their habitation." We wish the day would come when authors would cease to vomit absolute avalanches of nonsense, or when we at least should be able to escape them.

Pretty Lessons in Verse; with some Lessons in Latin in Easy Rhyme, by Sara Coleridge. (King and Co.)—So much interest was raised by the publication of the *Memoirs of Sara Coleridge* that we are not at all surprised to find a new edition of her "Lessons in Verse." Both in English and Latin they will pleasantly help little folk through what has been called "the bitterness of learning."

We are glad to see a republication also of Mrs. Trimmer's *History of the Robins*. (Nelson and Sons). The story in itself is very pretty, and it is greatly adorned by Mr. Giacomelli's abundant illustrations.

Boys, by Lady Barker, Author of "Travelling About." With illustrations. (Routledge).—These stories originally appeared, we believe, in *Routledge's Magazine*. They are so good that we are pleased to see them gathered together into one volume.

Round Games at Cards, by Cavendish, Author of the "Laws and Principles of Whist." (De La Rue and Co.)—We have given us in this little book clear rules for some fifteen round games at cards. Cavendish's authority is so high on whist that he can even on other games lay claim to as much infallibility as if he were the Pope himself. To any one not very well up in these games, some parts of the book are at first sight rather puzzling. "It follows," we read in one passage, "that the possession of a good poker face" (the italics are the author's) "is an advantage." If this had been said by a Liverpool rough of his wife, the meaning would have been clear to every one. Cavendish, however, does not seem to be writing especially for Lancashire.

From the same publishers we have also received the tenth edition of *Cavendish on Whist*, revised and greatly enlarged.

A Boy's Kingdom; or, Four Years in a Cave, by the Author of "Under the Lime Trees." (Seeley, Jackson, and Halliday).—This is an absurd story of a shipwrecked boy. He is left alone on the ship by the sailors, who go off in their boats, and he sinks down unconscious on the deck. A faithful dog takes him up in his
